## GLOSARIO

BGP: Protocolo de puerta de enlace fronteriza. Protocolo de enrutamiento entre dominios que reemplaza a EGP. BGP intercambia información de accesibilidad con otros sistemas BGP. Está definido por RFC 1163.

HSRP: Protocolo de enrutador Hot Standby. Proporciona una alta disponibilidad de red y cambios transparentes en la topología de la red. HSRP crea un grupo de enrutadores de reserva activa con un enrutador principal que atiende todos los paquetes enviados a la dirección de reserva activa. El enrutador principal es monitoreado por otros enrutadores del grupo. Si falla, uno de los enrutadores en espera hereda tanto la posición principal como la dirección de espera activa.

NTP: Network Time Protocol es un protocolo de Internet para sincronizar los relojes de los sistemas informáticos a través del enrutamiento de paquetes en redes con latencia variable. NTP utiliza UDP como su capa de transporte, usando el puerto 123. Está diseñado para resistir los efectos de la latencia variable.

OSPF: Primero, abra el camino más corto. Algoritmo de enrutamiento IGP jerárquico de estado de enlace propuesto como sucesor de RIP en la comunidad de Internet. Las características de OSPF incluyen enrutamiento de menor costo, enrutamiento de múltiples rutas y equilibrio de carga. OSPF se derivó de una versión anterior del protocolo IS-IS.

STP: Es un protocolo de red de capa 2 del modelo OSI (capa de enlace de datos). Su función es la de gestionar la presencia de bucles en topologías de red debido a la existencia de enlaces redundantes (necesarios en muchos casos para garantizar la disponibilidad de las conexiones). El protocolo permite a los dispositivos de interconexión activar o desactivar automáticamente los enlaces de conexión, de forma que se garantice la eliminación de bucles. STP es transparente a las estaciones de usuario.

VLAN: LAN virtual. Grupo de dispositivos en una o más LAN que están configurados (usando software de administración) para que puedan comunicarse como si estuvieran conectados al mismo cable, cuando en realidad están ubicados en varios segmentos de LAN diferentes.

## RESUMEN

Para esta actividad, se realizan las tareas asignadas en el escenario propuesto, acompañado de los respectivos procesos de documentación de la solución, correspondientes al registro de la configuración de cada uno de los dispositivos, la descripción detallada del paso a paso de cada una de las etapas realizadas durante su desarrollo, el registro de los procesos de verificación de conectividad mediante el uso de comandos ping, traceroute, show ip route, entre otros.

PALABRAS CLAVE: CISCO, Comutación, Enrutamiento, Redes, Sistemas.

## ABSTRACT

For this activity, the tasks assigned in the proposed scenario are carried out, accompanied by the respective documentation processes of the solution, corresponding to the registration of the configuration of each of the devices, the detailed description of the step by step of each of the stages carried out during its development, the registration of the connectivity verification processes through the use of ping, traceroute, and show ip route commands, among others.

KEY WORDS: CISCO, Switching, Routing, Networks, Systems

## 1. INTRODUCCIÓN

En el desarrollo de esta actividad se ponen a prueba una serie de retos que ponen a prueba los conceptos aprendidos durante el transcurso del diplomado de profundización y que a través de ellos se deban realizar los lineamientos estipulados para realizar la topología de red propuesta, estos pasos consisten en realizar implementaciones de la configuración en cada uno de los dispositivos que hacen parte de la red y estas van desde de seguridad hasta la aplicación de funciones de administración de red.

Se realiza la adecuación de los puertos de acceso con la configuración de VLAN adecuada, como se muestra en el diagrama de topología. Los puertos de host deben pasar inmediatamente al estado de reenvío (forwarding). Cada uno de los dispositivos está configurado previamente por su protocolo de enrutamiento OSPF en el área 0, se realiza la implementación de rutas predeterminadas y además, se configuran los switches para habilitar el enlace trunk 802.1Q entre ellos.

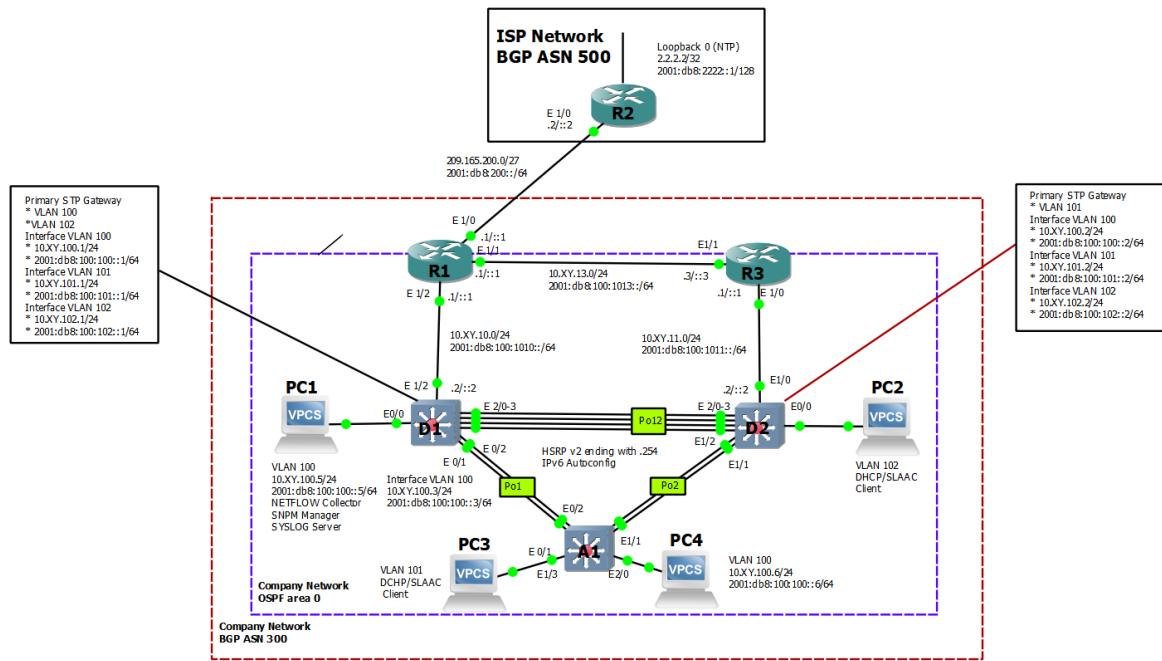

Al final de esta parte, todos los switches deben poder comunicarse. PC2 y PC3 deben recibir direccionamiento de DHCP y SLAAC. En todos los switches se habilita el protocolo Rapid Spanning-Tree y se realiza la configuración de D1 y D2 como raíz para las VLAN apropiadas, con prioridades de apoyo mutuo en caso de falla del switch. En todos los switches, se configura los puertos de acceso del host que se conectan a PC1, PC2, PC3 y PC4. En la Red de la Compañía se configura single-área OSPFv2 en área 0 con la observación de que la ruta por defecto deberá ser provista por BGP.

## 2. DESARROLLO DEL PROYECTO

## Objectives

Part 1: Build the Network and Configure Basic Device Settings and Interface Addressing

Part 2: Configure the Layer 2 Network and Host Support

Part 3: Configure Routing Protocols

Part 4: Configure First-Hop Redundancy

## Background / Scenario

In this skills assessment, you are responsible for completing the configuration of the network so there is full end-to-end reachability, so the hosts have reliable default gateway support, and so that management protocols are operational within the “Company Network” part of the topology. Be careful to verify that your configurations meet the provided specifications and that the devices perform as required.

Note: The routers used with CCNP hands-on labs are Cisco 7200 routers. The switches used in the labs are Cisco Catalyst L2 switches. Other routers, switches, and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and the output produced might vary from what is shown in the labs.

Note: Make sure that the switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Note: The letters "X, Y" represent the last two digits of your ID number (cédula).

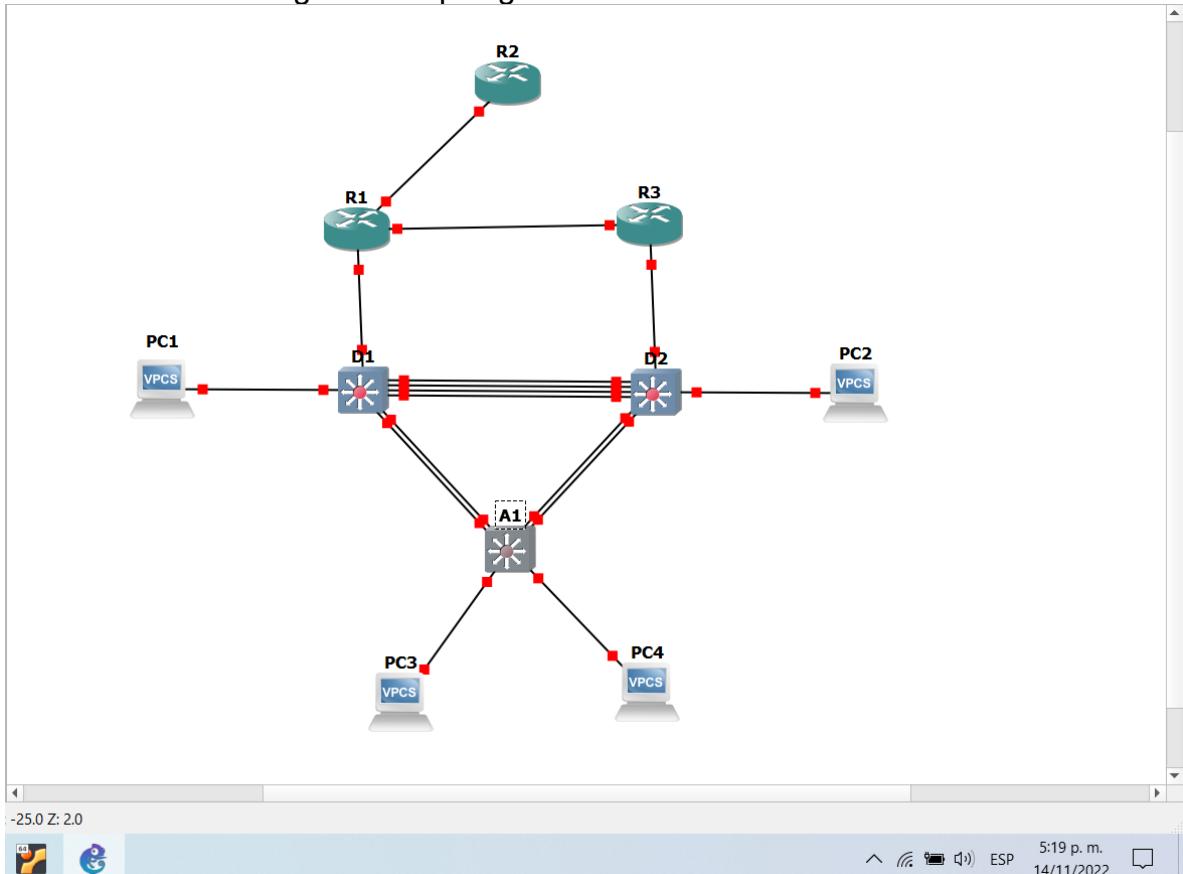

### 2.1.1. Part 1: Build the Network and Configure Basic Device Settings and Interface Addressing

In Part 1, you will set up the network topology and configure basic settings and interface addressing.

Step 1. Cable the network as shown in the topology.

Attach the devices as shown in the topology diagram, and cable as necessary.

Figura 2. Topología del escenario 1 en GNS3.

Fuente: Autor del documento.

Step 2. Configure basic settings for each device.

- Console into each device, enter global configuration mode, and apply the basic settings. The startup configurations for each device are provided below.

Router R1

```
R1#configure terminal  
R1(config)#hostname R1  
dispositivo  
R1(config)#ipv6 unicast-routing  
de direcciones IPv6
```

//Se configura el nombre del dispositivo  
//Se habilita el enrutamiento de direcciones IPv6

```

R1(config)#no ip domain lookup //Se desactiva la búsqueda
DNS
R1(config)#banner motd # R1, ENCOR Skills Assessment# //Se configura un
banner
R1(config)#line con 0
R1(config-line)# exec-timeout 0 0 //Se configura el tiempo de
salida exec
R1(config-line)# logging synchronous //Se habilita el inicio de
sesión sincrónico
R1(config-line)# exit

A1(config)#

```

b. Save the running configuration to startup-config on all devices.

R1#copy running-config startup-config  
del dispositivo //Se guarda la configuración

R2#copy running-config startup-config  
del dispositivo //Se guarda la configuración

R3#copy running-config startup-config  
del dispositivo //Se guarda la configuración

D1#copy running-config startup-config  
del dispositivo //Se guarda la configuración

D2#copy running-config startup-config  
del dispositivo //Se guarda la configuración

A1#copy running-config startup-config  
del dispositivo //Se guarda la configuración

c. Configure PC 1 and PC 4 host addressing as shown in the addressing table.  
Assign a default gateway address of 10.56.100.254 which will be the HSRP  
virtual IP address used in Part 4.

PC1> ip 10.9.100.5 255.255.255.0 10.9.100.254 //Se configura el  
direcccionamiento IPv4 del equipo

PC1> ip 2001:db8:100:100::5/64 eui-64 //Se configura el  
direcccionamiento IPv6 del equipo

PC4> ip 10.9.100.6 255.255.255.0 10.9.100.254 //Se configura el  
direcccionamiento IPv4 del equipo

PC4> ip 2001:db8:100:100::6/64 eui-64 //Se configura el  
direcccionamiento IPv6 del equipo

## 2.1.2. Part 2. Configure the Layer 2 Network and Host Support

In this part of the Skills Assessment, you will complete the Layer 2 network configuration and set up basic host support. At the end of this part, all the switches should be able to communicate. PC2 and PC3 should receive addressing from DHCP and SLAAC.

Your configuration tasks are as follows:

Tabla 2. Tabla de tareas a realizar en la parte 2.

| Task# | Task   | Specification   |
|-------|--|---|
| 2.1   | On all switches, configure IEEE 802.1Q trunk interfaces on interconnecting switch links  | Enable 802.1Q trunk links between: <ul style="list-style-type: none"><li>• D1 and D2</li><li>• D1 and A1</li><li>• D2 and A1</li></ul>  |
| 2.2   | On all switches, change the native VLAN on trunk links.  | Use VLAN 999 as the native VLAN.  |
| 2.3   | On all switches, enable the Rapid Spanning-Tree Protocol.  | Use Rapid Spanning Tree.  |
| 2.4   | On D1 and D2, configure the appropriate RSTP root bridges based on the information in the topology diagram.<br><br>D1 and D2 must provide backup in case of root bridge failure. | Configure D1 and D2 as root for the appropriate VLANs with mutually supporting priorities in case of switch failure.  |
| 2.5   | On all switches, create LACP EtherChannels as shown in the topology diagram.   | Use the following channel numbers: <ul style="list-style-type: none"><li>• D1 to D2 – Port channel 12</li><li>• D1 to A1 – Port channel 1</li><li>• D2 to A1 – Port channel 2</li></ul> |
| 2.6   | On all switches, configure host access ports connecting to PC1, PC2, PC3, and PC4.   | Configure access ports with appropriate VLAN settings as shown in the topology diagram.<br><br>Host ports should transition immediately to forwarding state.                            |
| 2.7   | Verify IPv4 DHCP services.   | PC2 and PC3 are DHCP clients and should be receiving valid IPv4 addresses.  |
| 2.8   | Verify local LAN connectivity.   | PC1 should successfully ping: <ul style="list-style-type: none"><li>• D1: 10.9.100.1</li><li>• D2: 10.9.100.2</li><li>• PC4: 10.9.100.6</li></ul>                                       |

| Task# | Task | Specification  |
|-------|------|--|
|       |      | <p>PC2 should successfully ping:</p> <ul style="list-style-type: none"> <li>• D1: 10.9.102.1</li> <li>• D2: 10.9.102.2</li> </ul> <p>PC3 should successfully ping:</p> <ul style="list-style-type: none"> <li>• D1: 10.9.101.1</li> <li>• D2: 10.9.101.2</li> </ul> <p>PC4 should successfully ping:</p> <ul style="list-style-type: none"> <li>• D1: 10.9.100.1</li> <li>• D2: 10.9.100.2</li> <li>• PC1: 10.9.100.5</li> </ul> |

Figura 4. Verificación del protocolo DHCP en PC3.

The screenshot shows a Solar-PuTTY terminal window titled "Virtual PC Simulator". The window displays a command-line interface for configuring network interfaces. The user has run commands to set up an interface (IP 10.9.101.210/24, GW 10.9.101.254) and another (IP 10.9.101.210/24, GW 10.9.101.254). The terminal window includes a title bar with tabs for various nodes (R1, R2, R3, D1, D2, A1, PC1, PC2, PC3, PC4), a status bar at the bottom indicating the session is "Solar-PuTTY free tool" from "solarwinds", and a system tray icon.

```

### 2.1.3. Part 3: Configure Routing Protocols

In this part, you will configure IPv4 and IPv6 routing protocols. At the end of this part, the network should be fully converged. IPv4 and IPv6 pings to the Loopback 0 interface from D1 and D2 should be successful.

Note: Pings from the hosts will not be successful because their default gateways are pointing to the HSRP address which will be enabled in Part 4.

Your configuration tasks are as follows:

Tabla 3. Tabla de tareas a realizar en la parte 3.

| Task# | Task   | Specification   |
|-------|--|---|
| 3.1   | On the “Company Network” (i.e., R1, R3, D1, and D2), configure single-area OSPFv2 in area 0.         | <p>Use OSPF Process ID <b>4</b> and assign the following router-IDs:</p> <ul style="list-style-type: none"> <li>• R1: 0.0.4.1</li> <li>• R3: 0.0.4.3</li> <li>• D1: 0.0.4.131</li> <li>• D2: 0.0.4.132</li> </ul> <p>On R1, R3, D1, and D2, advertise all directly connected networks / VLANs in Area 0.</p> <ul style="list-style-type: none"> <li>• On R1, do not advertise the R1 – R2 network.</li> <li>• On R1, propagate a default route. Note that the default route will be provided by BGP.</li> </ul> <p>Disable OSPFv2 advertisements on:</p> <ul style="list-style-type: none"> <li>• D1: All interfaces except E1/2</li> <li>• D2: All interfaces except E1/0</li> </ul> |
| 3.2   | On the “Company Network” (i.e., R1, R3, D1, and D2), configure classic single-area OSPFv3 in area 0. | <p>Use OSPF Process ID <b>6</b> and assign the following router-IDs:</p> <ul style="list-style-type: none"> <li>• R1: 0.0.6.1</li> <li>• R3: 0.0.6.3</li> <li>• D1: 0.0.6.131</li> <li>• D2: 0.0.6.132</li> </ul> <p>On R1, R3, D1, and D2, advertise all directly connected networks / VLANs in Area 0.</p> <ul style="list-style-type: none"> <li>• On R1, do not advertise the R1 – R2 network.</li> <li>• On R1, propagate a default route. Note that the default route will be provided by BGP.</li> </ul> <p>Disable OSPFv3 advertisements on:</p> <ul style="list-style-type: none"> <li>• D1: All interfaces except E1/2</li> <li>• D2: All interfaces except E1/0</li> </ul> |
| 3.3   | On R2 in the “ISP Network”, configure MP-BGP.  | <p>Configure two default static routes via interface Loopback 0:</p> <ul style="list-style-type: none"> <li>• An IPv4 default static route.</li> <li>• An IPv6 default static route.</li> </ul> <p>Configure R2 in BGP ASN <b>500</b> and use the router-id 2.2.2.2.</p>  |

| Task# | Task   | Specification   |
|-------|--|---|
|       |  | <p>Configure and enable an IPv4 and IPv6 neighbor relationship with R1 in ASN 300.</p> <p>In IPv4 address family, advertise:</p> <ul style="list-style-type: none"> <li>• The Loopback 0 IPv4 network (/32).</li> <li>• The default route (0.0.0.0/0).</li> </ul> <p>In IPv6 address family, advertise:</p> <ul style="list-style-type: none"> <li>• The Loopback 0 IPv4 network (/128).</li> <li>• The default route (::/0).</li> </ul>  |
| 3.4   | <p>On R1 in the “ISP Network”, configure MP-BGP.</p> | <p>Configure two static summary routes to interface Null 0:</p> <ul style="list-style-type: none"> <li>• A summary IPv4 route for 10.9.0.0/8.</li> <li>• A summary IPv6 route for 2001:db8:100::/48.</li> </ul> <p>Configure R1 in BGP ASN <b>300</b> and use the router-id 1.1.1.1.</p> <p>Configure an IPv4 and IPv6 neighbor relationship with R2 in ASN 500.</p> <p>In IPv4 address family:</p> <ul style="list-style-type: none"> <li>• Disable the IPv6 neighbor relationship.</li> <li>• Enable the IPv4 neighbor relationship.</li> <li>• Advertise the 10.9.0.0/8 network.</li> </ul> <p>In IPv6 address family:</p> <ul style="list-style-type: none"> <li>• Disable the IPv4 neighbor relationship.</li> <li>• Enable the IPv6 neighbor relationship.</li> <li>• Advertise the 2001:db8:100::/48 network.</li> </ul> |

Figura 11. Presentación de los comandos OSPF en D1.

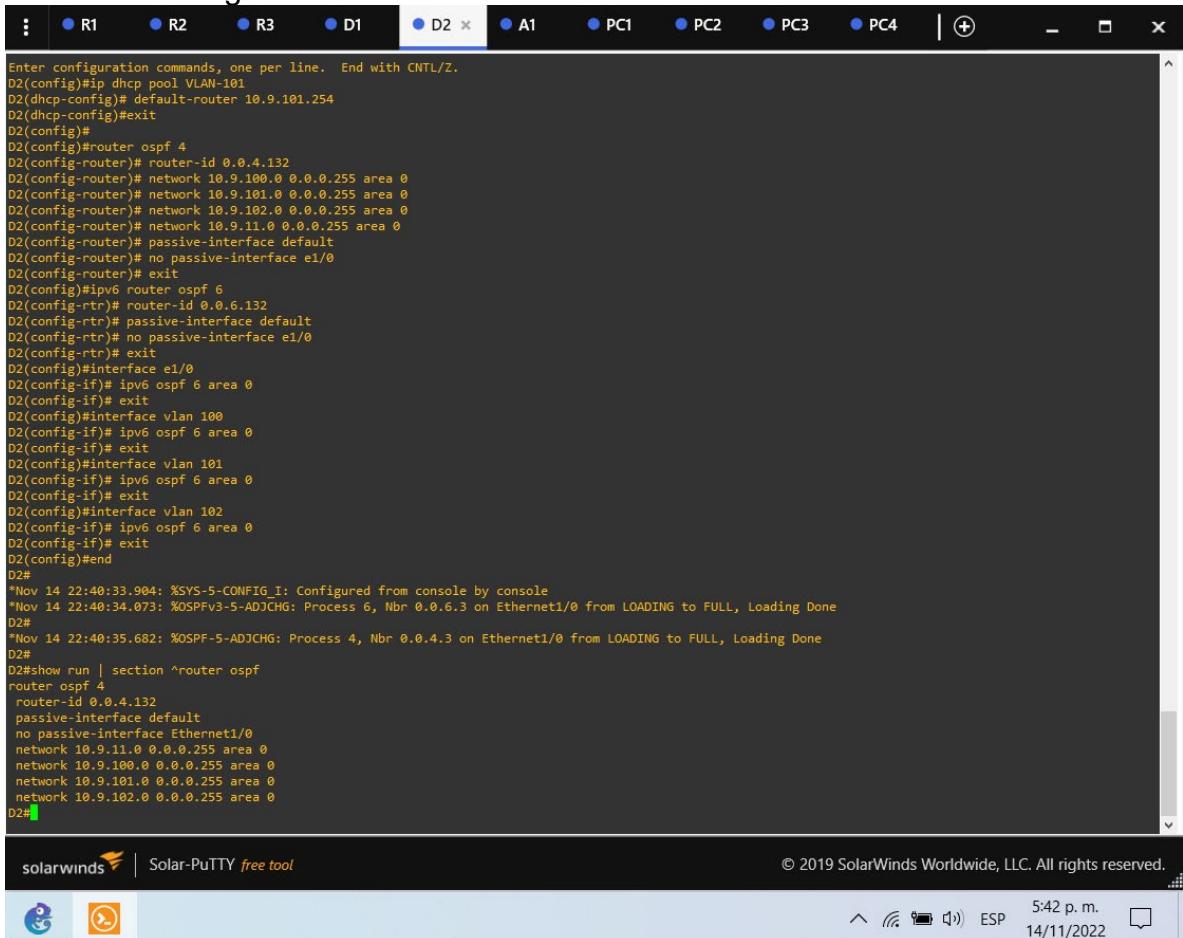

The screenshot shows a SolarWinds Putty terminal window titled 'D1'. The window displays the configuration of OSPF on router D1. The configuration includes setting the router-id to 0.0.4.131, defining area 0, and specifying networks for interfaces e1/2, e1/3, and e1/4. It also includes configurations for VLAN interfaces 100 and 101. The session title bar shows other routers in the network: R1, R2, R3, D2, A1, PC1, PC2, PC3, and PC4. The SolarWinds logo and 'Solar-PuTTY free tool' are visible at the bottom left, and copyright information for SolarWinds Worldwide, LLC is at the bottom right. The timestamp in the bottom right corner is 5:41 p.m. on 14/11/2022.

Figura 12. Presentación de los comandos OSPF en D2.

The screenshot shows a SolarWinds Putty terminal window titled 'D2'. The window displays the configuration mode of router D2, specifically for OSPF. The configuration includes setting the default-router to 10.9.101.254, defining area 0, and configuring four network interfaces (e1/0, e1/1, e1/2, e1/3) with their respective IP ranges. It also includes passive-interface configurations and IPv6 OSPF settings. The session ends with a log message indicating OSPF adjacencies have reached the FULL state. The SolarWinds logo and copyright information are visible at the bottom of the window.

Figura 17. Presentación de los comandos BGP y rutas estáticas en R2.

The screenshot shows a SolarWinds Putty terminal window titled 'R2'. The window displays the configuration of BGP on router R2 and lists static routes. The configuration includes defining neighbors (R1, R3, D1, D2, A1, PC1, PC2, PC3, PC4) and their respective remote-AS numbers (300, 209.165.200.225, 209.165.200.225, 209.165.200.225, 209.165.200.225, 209.165.200.225, 209.165.200.225, 209.165.200.225). It also shows the activation of BGP processes and the display of configured routes.

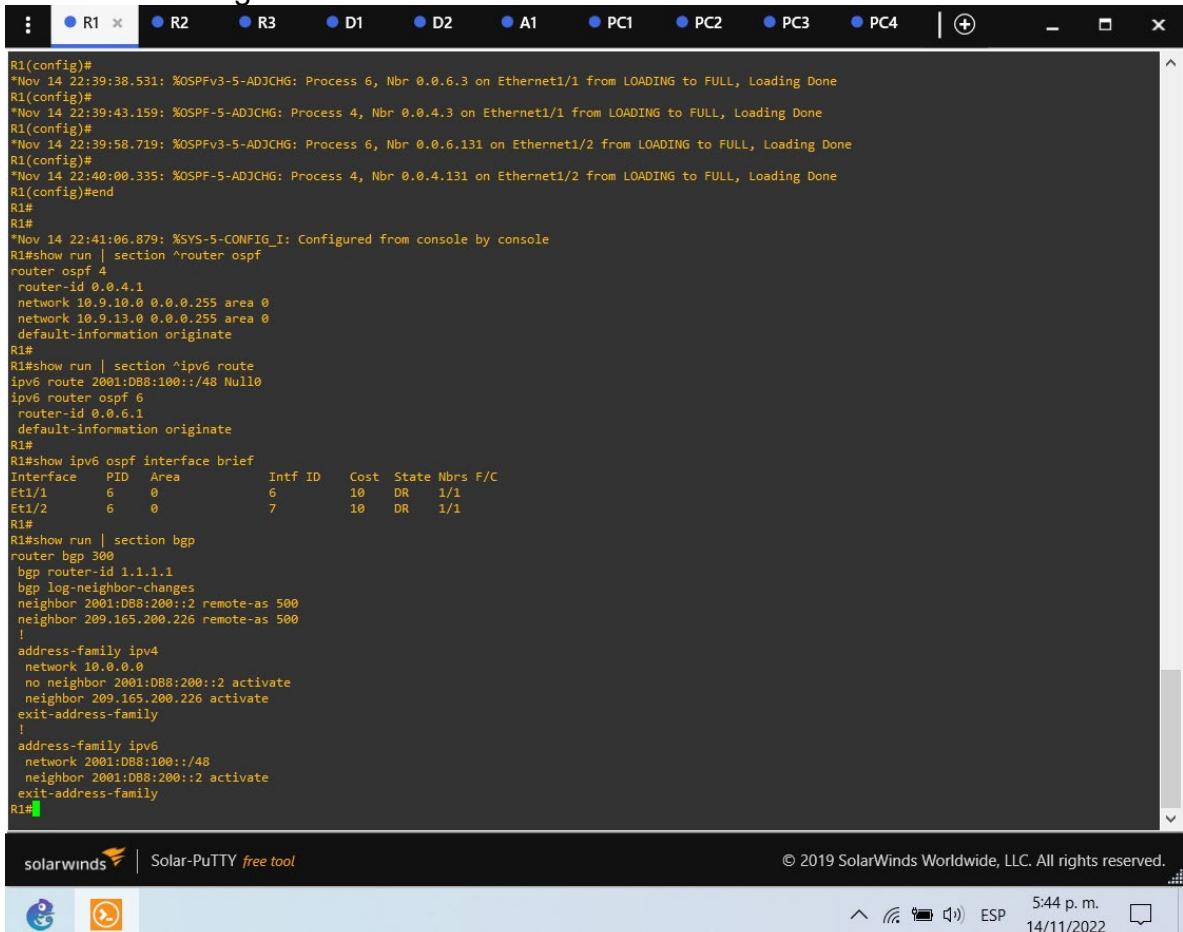

```
R2(config-router)# neighbor 2001:db8:200::1 remote-as 300
R2(config-router)# address-family ipv4
R2(config-router-af)# neighbor 209.165.200.225 activate

The screenshot shows a SolarWinds PuTTY window titled "R1". The terminal session displays the configuration of OSPF and BGP on Router R1. The configuration includes OSPF processes 4 and 6, and BGP process 300 with neighbors at 2001:DB8:200::2 and 209.165.200.226, both with AS number 500. The BGP session is active. The PuTTY interface also shows system status icons at the bottom.

#### 2.1.4. Part 4: Configure First Hop Redundancy

In this part, you will configure HSRP version 2 to provide first-hop redundancy for hosts in the “Company Network”.

Your configuration tasks are as follows:

Tabla 4. Tabla de tareas a realizar en la parte 4.

| Task# | Task                                | Specification   |
|-------|-------------------------------------|---|
| 4.1   | On D1, create IP SLAs that test the | <p>Create two IP SLAs.</p> <ul style="list-style-type: none"> <li>• Use SLA number <b>4</b> for IPv4.</li> <li>• Use SLA number <b>6</b> for IPv6.</li> </ul> |

| Task# | Task   | Specification  |
|-------|--|--|
|       | reachability of R1 interface E1/2.                                     | <p>The IP SLAs will test availability of R1 E1/2 interface every 5 seconds.</p> <p>Schedule the SLA for immediate implementation with no end time.</p> <p>Create an IP SLA object for IP SLA 4 and one for IP SLA 6.</p> <ul style="list-style-type: none"> <li>• Use track number <b>4</b> for IP SLA 4.</li> <li>• Use track number <b>6</b> for IP SLA 6.</li> </ul> <p>The tracked objects should notify D1 if the IP SLA state changes from down to up after 10 seconds, or from up to down after 15 seconds.</p>   |
| 4.2   | On D2, create IP SLAs that test the reachability of R3 interface E1/0. | <p>Create two IP SLAs.</p> <ul style="list-style-type: none"> <li>• Use SLA number <b>4</b> for IPv4.</li> <li>• Use SLA number <b>6</b> for IPv6.</li> </ul> <p>The IP SLAs will test availability of R3 E1/0 interface every 5 seconds.</p> <p>Schedule the SLA for immediate implementation with no end time.</p> <p>Create an IP SLA object for IP SLA 4 and one for IP SLA 6.</p> <ul style="list-style-type: none"> <li>• Use track number <b>4</b> for IP SLA 4.</li> <li>• Use track number <b>6</b> for IP SLA 6.</li> </ul> <p>The tracked objects should notify D1 if the IP SLA state changes from down to up after 10 seconds, or from up to down after 15 seconds.</p> |
| 4.3   | On D1, configure HSRPv2.   | <p>D1 is the primary router for VLANs 100 and 102; therefore, their priority will also be changed to 150.</p> <p>Configure HSRP version 2.</p> <p>Configure IPv4 HSRP group <b>104</b> for VLAN 100:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address <b>10.9.100.254</b>.</li> <li>• Set the group priority to <b>150</b>.</li> <li>• Enable preemption.</li> <li>• Track object 4 and decrement by 60.</li> </ul> <p>Configure IPv4 HSRP group <b>114</b> for VLAN 101:</p>  |

| Task# | Task                     | Specification   |
|-------|--------------------------|---|
|       |                          | <ul style="list-style-type: none"> <li>• Assign the virtual IP address <b>10.9.101.254</b>.</li> <li>• Enable preemption.</li> <li>• Track object 4 to decrement by 60.</li> </ul> <p>Configure IPv4 HSRP group <b>124</b> for VLAN 102:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address <b>10.9.102.254</b>.</li> <li>• Set the group priority to <b>150</b>.</li> <li>• Enable preemption.</li> <li>• Track object 4 to decrement by 60.</li> </ul> <p>Configure IPv6 HSRP group <b>106</b> for VLAN 100:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address using <b>ipv6 autoconfig</b>.</li> <li>• Set the group priority to <b>150</b>.</li> <li>• Enable preemption.</li> <li>• Track object 6 and decrement by 60.</li> </ul> <p>Configure IPv6 HSRP group <b>116</b> for VLAN 101:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address using <b>ipv6 autoconfig</b>.</li> <li>• Enable preemption.</li> <li>• Track object 6 and decrement by 60.</li> </ul> <p>Configure IPv6 HSRP group <b>126</b> for VLAN 102:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address using <b>ipv6 autoconfig</b>.</li> <li>• Set the group priority to <b>150</b>.</li> <li>• Enable preemption.</li> <li>• Track object 6 and decrement by 60.</li> </ul> |
|       | On D2, configure HSRPv2. | <p>D2 is the primary router for VLAN 101; therefore, the priority will also be changed to 150.</p> <p>Configure HSRP version 2.</p> <p>Configure IPv4 HSRP group <b>104</b> for VLAN 100:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address <b>10.9.100.254</b>.</li> <li>• Enable preemption.</li> <li>• Track object 4 and decrement by 60.</li> </ul> <p>Configure IPv4 HSRP group <b>114</b> for VLAN 101:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address <b>10.9.101.254</b>.</li> <li>• Set the group priority to <b>150</b>.</li> <li>• Enable preemption.</li> <li>• Track object 4 to decrement by 60.</li> </ul> <p>Configure IPv4 HSRP group <b>124</b> for VLAN 102:</p> <ul style="list-style-type: none"> <li>• Assign the virtual IP address <b>10.9.102.254</b>.</li> <li>• Enable preemption.</li> <li>• Track object 4 to decrement by 60.</li> </ul>  |

## CONCLUSIONES

Con las herramientas GNS3, se encuentran inconvenientes para encontrar imágenes con las que probar las habilidades, y algunos no podían reconocer la mayoría de los comandos necesarios para conectarse entre las herramientas. Equipo. Entonces, el objetivo es reflejar las habilidades y responsabilidades involucradas en la realización de actividades de conectividad, así como la validación de la implementación realizada al ejecutar el contenido recomendado en una topología de red.

Esta prueba le permite comprender la aplicación de varios conceptos de redes, aumento de tecnología y verificación de aplicaciones en dispositivos, incluido el aumento de VLAN en dispositivos de conmutación de capa 3 que proporcionan enrutamiento ipv6 y el uso de ASN especificado en BGP.

En última instancia, este enfoque permite que los administradores de red estén expuestos a una gran parte del contenido, ya que cada implementación debe cumplir con los requisitos, y los conceptos aprendidos en el curso son fundamentales para comprender y completar con éxito la operación.
