GLOSARIO

PC: Computador personal es un dispositivo electrónico que permite al usuario realizar una inmensa cantidad de tareas, por ejemplo, navegar por internet, crear y editar documentos, enviar correos, entre otros.

ROUTER: Dispositivo de red que se utiliza para conectar varias redes y dirigir el tráfico entre ellas, con el uso de tablas de direccionamiento IP, que permiten al dispositivo encontrar las mejores rutas para el envío de datos.

SWITCH: Dispositivo de red que se utiliza para conectar dispositivos en una red local (LAN) y dirigir el tráfico de red entre ellos, con el uso de tablas de direccionamiento MAC, que permiten al dispositivo determinar a qué dispositivo se realizará el envío de datos.

CISCO: Compañía de tecnología que ofrece una amplia variedad de soluciones de redes y comunicaciones, como hardware, software y servicios.

ENRUTAMIENTO ESTÁTICO: Método de enrutamiento en el que el administrador de la red configura manualmente las rutas en los Router con el fin de interconectar varios dispositivos, dicho enrutamiento permanece estático a menos que sea modificado manualmente.

IPV4: La cuarta versión del protocolo IP que se utiliza para enviar y recibir datos a través de internet, utiliza direcciones de 32 bits y puede admitir hasta 4.3 mil millones de direcciones únicas.

IPV6: La sexta versión del protocolo IP que se utiliza para enviar y recibir datos a través de internet, utiliza direcciones de 128 bits siendo la evolución del protocolo orientada a admitir una cantidad exponencialmente mayor de direcciones únicas.

VRF: Función de enrutamiento virtual utilizada para crear múltiples instancias de la tabla de enrutamiento del Router, cada instancia es independiente con respecto a otra y tiene múltiples funciones como por ejemplo seccionar redes virtualmente.

VLAN: Por sus siglas red de área local virtual, se utiliza para segmentar redes en múltiples redes lógicas, lo que permite que dispositivos en diferentes ubicaciones físicas se comuniquen como si estuvieran en la misma red física.

ENLACE TRONCAL: Enlace de red de alta velocidad que permite la conexión entre dispositivos, permitiendo también el enrutamiento de diferentes tráficos segmentados por VLAN por un único enlace.

ENLACE ACCESO: Enlace de red que comúnmente conecta un dispositivo final, como una computadora o impresora, a un Switch o Router.

ETHERCHANNEL: Tecnología de CISCO utilizada para combinar múltiples enlaces físicos entre dos dispositivos como un solo enlace lógico, con el objetivo de proporcionar mejoras de rendimiento y redundancia a prueba de fallos.

AAA: Sistema de autenticación, autorización y auditoria, se utiliza para controlar el acceso a la red como método de seguridad, y de seguimiento de la actividad de los usuarios en la red.

RESUMEN

El objetivo de la prueba de habilidades prácticas es evaluar las destrezas adquiridas en el proceso de formación de pregrado en CISCO CCNA y el diplomado de profundización en CISCO CCNP.

Se utilizará el software de simulación GNS3 para resolver un escenario empresarial que requiere la implementación de diferentes técnicas de enrutamiento, segmentación y redundancia, como ENRUTAMIENTO ESTÁTICO, VRF, VLAN y ETHERCHANNEL.

El objetivo es interconectar dos secciones de la red y garantizar la alta seguridad de la red con el uso de sistemas AAA para controlar el acceso a la red.

Esto garantizará la interconexión, redundancia, seguridad y privacidad de los datos de la red, que son objetivos indispensables para la implementación de infraestructuras de telecomunicaciones.

Palabras Clave: CISCO, CCNP, Comunicación, Enrutamiento, Redes, Electrónica.

ABSTRACT

The objective of the practical skills test is to evaluate the skills acquired in the CISCO CCNA undergraduate training process and the deepening CISCO CCNP diploma.

GNS3 simulation software will be used to solve a business scenario that requires the implementation of different routing, segmentation, and redundancy techniques such as STATIC ROUTING, VRF, VLAN and ETHERCHANNEL.

The goal is to interconnect two sections of the network and ensure high network security with the use of AAA systems to control network access.

This will guarantee the interconnection, redundancy, security, and privacy of network data, which are essential objectives for the implementation of telecommunications infrastructures.

Keywords: CISCO, CCNP, Routing, Swicthing, Networking, Electronics.

INTRODUCCIÓN

En la actualidad, las telecomunicaciones son fundamentales en el mundo empresarial, la conectividad y la disponibilidad de los sistemas de información son vitales para el correcto funcionamiento y desempeño de una organización, habiéndose creado industrias que dependen incluso completamente de un buen desempeño de una red y acceso a internet.

En esta prueba de habilidades se abordan temas de como configurar correctamente diferentes topologías y sistemas de red e interconexión, la cual será llevada a cabo en el software de simulación GNS3.

El escenario planeado solicita la configuración de una red multi-VRF donde la red admite dos grupos de usuarios “usuarios generales” y “usuarios especiales” los cuales tienen acceso a los equipos dentro de su propio segmento de red, pero no hacia el otro segmento.

Por lo cual se configurarán los diferentes dispositivos activos de la red para que sean capaces de brindar conectividad IPv4 e IPv6, utilizando conceptos de enrutamiento estático, VLAN.

La topología de red tendrá un segmento de red redundante con el fin de brindar fiabilidad y disponibilidad de la red.

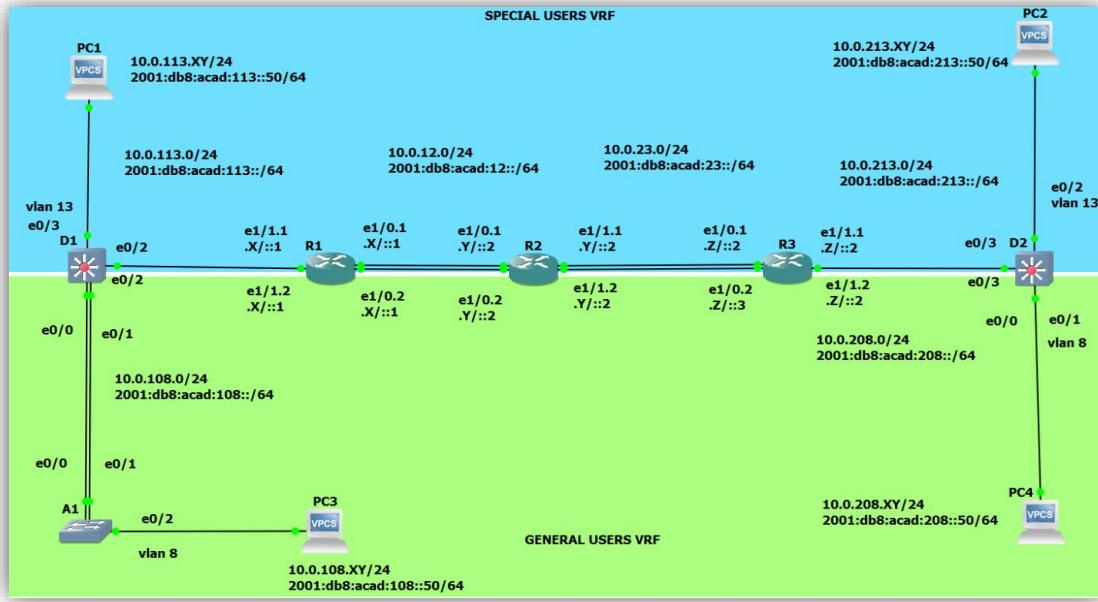

Todos los dispositivos activos de la red tendrán altos niveles de seguridad gracias a la implementación de sistemas autenticación para el acceso a dispositivos críticos de la red, basados en usuarios y contraseñas de inicio de sesión y habilitación de permisos especiales protegidos por contraseña.

Entregando como producto final una red segmentada para diferentes usos empresariales, redundante, fiable y segura.

ESCENARIO

El escenario propuesto con el fin de poner a prueba los niveles de comprensión y solución de problemas relacionados con diversos aspectos de administración de redes de telecomunicaciones, es el siguiente.

Figura 1 Escenario

Fuente: Guía de actividades

Prueba de habilidades en donde XYZ corresponden a los números 723, la construcción del escenario planteado estará compuesta por 3 enrutadores que tendrán las etiquetas R1, R2, R3, 3 switches que tendrán las etiquetas D1, D2, A1 y 4 computadores que tendrán las etiquetas PC1, PC2, PC3, PC4.

De acuerdo con Edgeworth, Garza Rios, Gooley y Hucaby (2020), en los dispositivos de interconexión CISCO se utilizan diversos protocolos y tecnologías para la gestión y administración de una red empresarial, por tanto, el escenario será desarrollado en base a ello.

La ejecución del escenario estará hecha por partes.

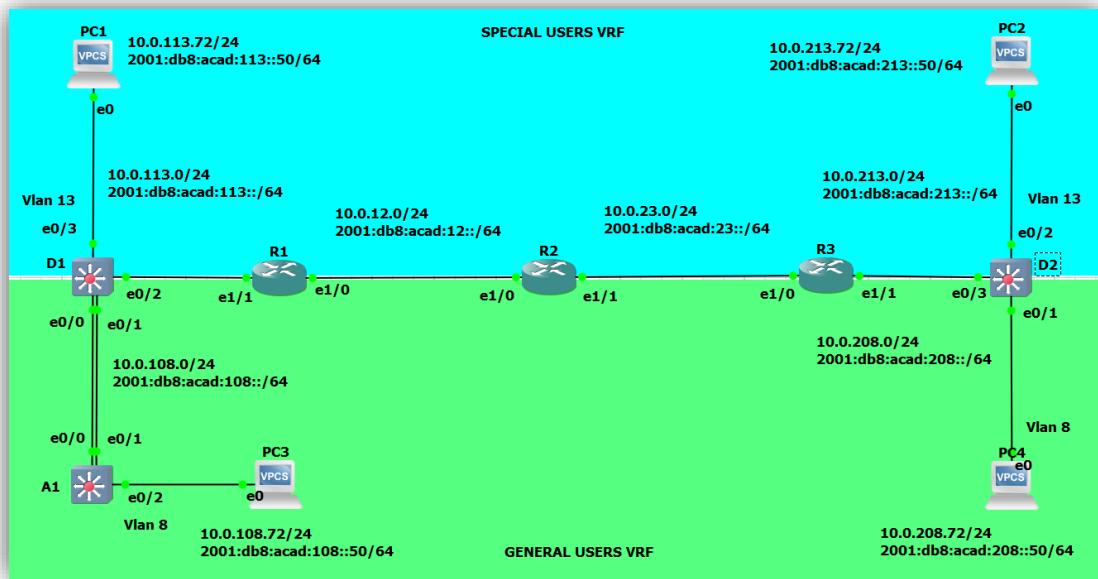

1 CONSTRUIR LA RED Y CONFIGURAR LOS AJUSTES BÁSICOS DEL DISPOSITIVO Y EL DIRECCIONAMIENTO DE LA INTERFAZ

Creación de la topología en el simulador GN3, tabla de enrutamiento, configuraciones básicas para el direccionamiento de las interfaces.

1.1 CONEXIÓN DE DISPOSITIVOS SEGÚN DIAGRAMA DE TOPOLOGÍA

En base al escenario propuesto de evaluación de habilidades se realizan las conexiones pertinentes en el software de simulación GNS3 además de las notaciones para cada parte de la red con su respectivo identificador de interfaz.

Figura 2 Construcción de la red en GNS3

Fuente: Elaboración propia

1.2 CONFIGURACIONES BÁSICAS

Se realizan las configuraciones básicas de los dispositivos activos con el fin de prepararlos con las configuraciones generales que tendrán en común, como lo son el nombre del dispositivo, funcionalidades IPv6, búsqueda DNS, acceso por consola, notificaciones, VLAN ID, VLAN name, y guardar las configuraciones, conforme a los siguientes comandos.

Tabla 1 Configuraciones básicas

Command	Description
enable	Accede al modo privilegiado
configure terminal	Entra en el modo de configuración global
hostname *	Configura el nombre del dispositivo en donde * será la etiqueta del dispositivo
ipv6 unicast-routing	Activa IPv6 en el dispositivo
no ip domain lookup	Desactiva la búsqueda DNS
banner motd # *, ENCOR Skills Assessment, Scenario 2 #	Configura un banner en el dispositivo, en donde * será la etiqueta del dispositivo
line con 0	Accede a las opciones de configuración de la línea de consola
exec-timeout 0 0	Establece el tiempo de espera inactivo para la sesión
logging synchronous	Configura que mensajes se muestran en la terminal
Vlan *	En un switch entra en la configuración de la vlan seleccionada con el ID * que sea requerido
Name *	Configura el nombre de la vlan con el nombre * que sea requerido
exit	Da un paso atrás en el nivel de jerarquía de las configuraciones
copy running-config startup-config	Guarda la configuración actual a la memoria de inicio

Se accederá a cada dispositivo a través del software Solar-PuTTY para realizar las configuraciones básicas y guardarlos con sus respectivas etiquetas.

2 CONFIGURAR VRF Y ENRUTAMIENTO ESTÁTICO

Configurar VRF-Lite en los tres enrutadores y las rutas estáticas adecuadas para admitir la accesibilidad de un extremo a otro además de las pruebas de conexión pertinentes desde R1 hasta R3 en cada VRF.

El proceso de configuración de los grupos VRF se hará por partes.

2.1 DEFINICIÓN DE GRUPOS VRF

Tabla 3 Tabla de tareas 2.1

Taks	Specification
En R1, R2 y R3, configure VRF-Lite VRFs como se muestra en el diagrama de topología.	Configure dos VRF: General-Users Special-Users Los VRF deben soportar IPv4 e IPv6.

Tabla 4 Configuración de instancias VRF

Command	Description
vrf definition *	Crea un grupo VRF con el nombre * que sea requerido
address-family ipv4	Habilita IPv4 al VRF
address-family ipv6	Habilita IPv6 al VRF

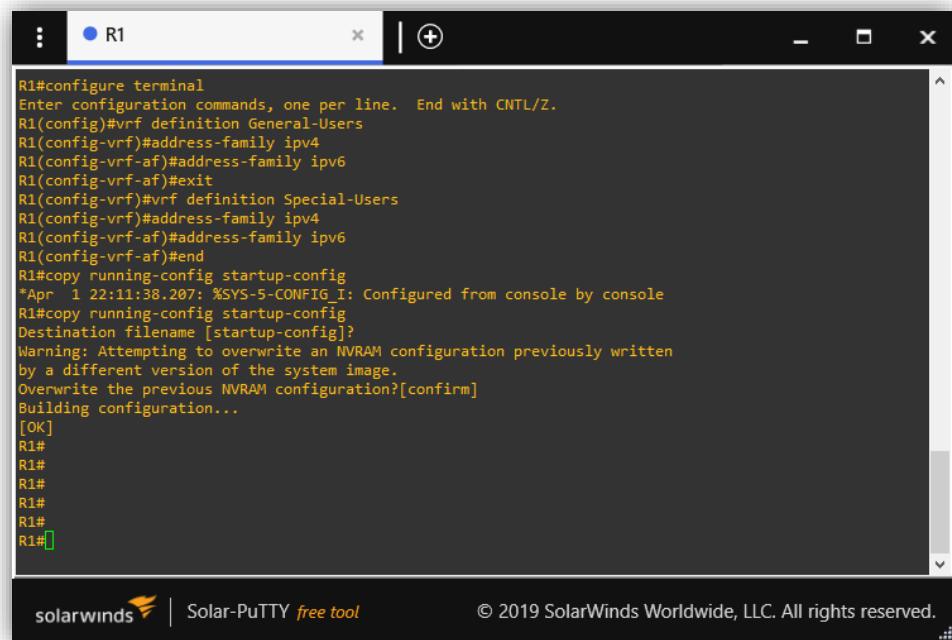

Se configuran 2 VRF-Lite con soporte para IPv4 e IPv6 con los nombres requeridos para los enrutadores R1, R2, R3.

Scripts para los dispositivos

R1, R2, R3

```
enable
configure terminal
vrf definition General-Users
address-family ipv4
address-family ipv6
exit
vrf definition Special-Users
address-family ipv4
address-family ipv6
end
copy running-config startup-config
```

Figura 13 Configuración VRF con soporte IPv4 e IPv6 y guardado R1

The screenshot shows a terminal window titled 'R1' running on Solar-PuTTY. The window displays the configuration commands for creating two VRFs: 'General-Users' and 'Special-Users', each with both IPv4 and IPv6 address families. After defining the VRFs, the configuration is copied from the running config to the startup config. A warning message appears about overwriting the NVRAM configuration, followed by a confirmation prompt. The configuration is then built, and the session ends with several blank lines.

```
R1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)#vrf definition General-Users
R1(config-vrf)#address-family ipv4
R1(config-vrf-af)#address-family ipv6
R1(config-vrf-af)#exit
R1(config-vrf)#vrf definition Special-Users
R1(config-vrf)#address-family ipv4
R1(config-vrf-af)#address-family ipv6
R1(config-vrf-af)#end
R1#copy running-config startup-config

2.2 CONFIGURACIÓN DE INTERFACES

Tabla 5 Tabla de tareas 2.2

Taks	Specification
En R1, R2 y R3, configure las interfaces IPv4 e IPv6 en cada VRF según lo detallado en la tabla de direcciones mencionada anteriormente.	<p>Todos los Routers utilizarán Router-On-A-Stick en sus interfaces e1/1.x para admitir la separación de los VRF.</p> <p>Subinterfaz 1:</p> <ul style="list-style-type: none"> En el VRF Special Users Usar encapsulación dot1q Direcciones IPv4 e IPv6 GUA y link-local addresses Habilitar las interfaces <p>Subinterfaz 2:</p> <ul style="list-style-type: none"> En el VRF General Users Usar encapsulación dot1q Direcciones IPv4 e IPv6 GUA y link-local addresses Habilitar las interfaces

Se configuran las interfaces y subinterfaces IPv4 e IPv6 para los enrutadores R1, R2, R3 en cada VRF.

Tabla 6 Configuración de interfaces y subinterfaces VRF

Command	Description
interface e1/0	Accede a la interfaz e1/0
no shutdown	Activa administrativamente la interfaz
interface e1/0.1	Accede a la subinterfaz e1/0.1
encapsulation dot1q 13	Permite el protocolo dot1q con el id 13, para vlan
vrf forwarding Special-Users	Habilita el envío para el vrf Special-Users
ip address 10.0.12.7 255.255.255.0	Configura la IPv4 de la interfaz o subinterfaz junto con su mascara de red
ipv6 address 2001:db8:acad:12::1/64	Configura la IPv6 y su mascara de red a la interfaz o subinterfaz
ipv6 address fe80::1:1 link-local	Configura la ip link-local IPv6 de la interfaz o subinterfaz

copy running-config startup-config
```

Figura 16 Configuración de las interfaces y subinterfaces VRF R1

The screenshot shows a Solar-PuTTY terminal window titled 'R1'. The window displays a series of configuration commands entered on R1# (Router 1). The commands configure three interfaces (e1/0, e1/1, e1/2) with specific encapsulations (dot1q), VLANs (13, 8, 8), and IP addresses. It also configures VRFs (Special-Users and General-Users) and their associated IP and IPv6 addresses. The configuration concludes with a copy of the running-config to startup-config and a warning about overwriting NVRAM. A note at the bottom indicates a duplex mismatch on Ethernet1/1.

```
R1#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
R1(config)#interface e1/0

2.3 CONFIGURACIÓN DE RUTAS ESTÁTICAS

Tabla 7 Tabla de tareas 2.3

Taks	Specification
En R1 y R3, configure rutas estáticas predeterminadas que apunten a R2.	Configurar las rutas estáticas VRF para IPv4 e IPv6 en ambas VRF.

Se configuran rutas estáticas en R1 y R3 apuntando hacia R2 para VRF con soporte para IPv4 e IPv6.

Tabla 8 Configuración rutas estáticas IPv4 y IPv6 VRF

Command	Description
ip route vrf Special-Users "red" "mascara" "destino"	Configura la ruta estática IPv4 para todas las redes del VRF Special-Users desde el origen hacia el destino
ip route vrf General-Users "red" "mascara" "destino"	Configura la ruta estática IPv4 para todas las redes del VRF General-Users desde el origen hacia el destino
ipv6 route vrf Special-Users "red y mascara IPv6" "destino IPv6"	Configura la ruta estática IPv6 para todas las redes del VRF Special-Users desde el origen hacia el destino
ipv6 route vrf General-Users "red y mascara IPv6" "destino IPv6"	Configura la ruta estática IPv6 para todas las redes del VRF General-Users desde el origen hacia el destino

En base a la sintaxis anterior de configuración de rutas estáticas, se configura el enrutamiento estático hacia las diferentes redes de cada subinterfaz.

Scripts para los dispositivos

```
R1
enable
configure terminal
ip route vrf Special-Users 0.0.0.0 0.0.0.0 10.0.12.2
ip route vrf General-Users 0.0.0.0 0.0.0.0 10.0.12.2
ipv6 route vrf Special-Users ::/0 2001:db8:acad:12::2
ipv6 route vrf General-Users ::/0 2001:db8:acad:12::2
end
copy running-config startup-config

R2
enable
configure terminal

2.4 VERIFICACIÓN DE CONFIGURACIONES Y PRUEBAS DE CONECTIVIDAD

Tabla 9 Tabla de tareas 2.4

Taks	Specification
Verificar la conectividad en cada VRF.	Desde R1, verificar la conectividad hacia R3: ping vrf General-Users 10.0.208.9 ping vrf General-Users 2001:db8:acad:208::1 ping vrf Special-Users 10.0.213.9 ping vrf Special-Users 2001:db8:acad:213::1

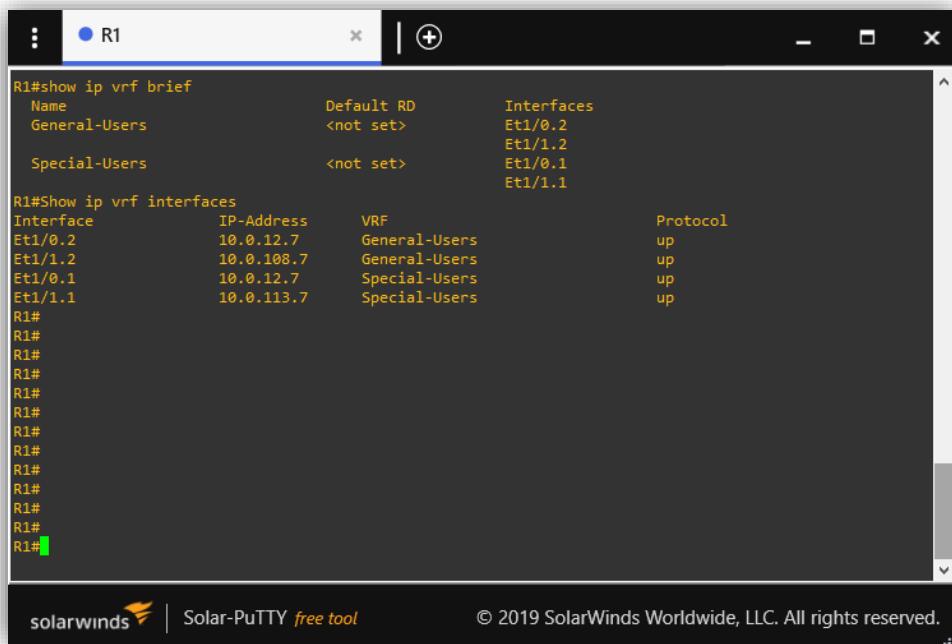

Se verifica la configuración y se realizan pruebas de conectividad entre cada VRF para asegurar su correcto funcionamiento.

Scripts para los dispositivos

```
R1, R2, R3
show ip vrf brief
Show ip vrf interfaces
show ip interface brief
show run | inc route
show ip route vrf General-Users
show ip route vrf Special-Users

Figura 24 Verificación de los grupos VRF R3

The screenshot shows a terminal window titled 'R3' displaying Cisco IOS command-line interface (CLI) output. The user has run two commands: 'show ip vrf brief' and 'show ip vrf interfaces'. The 'brief' command output shows two VRF entries: 'General-Users' and 'Special-Users', each associated with a specific IP address and a list of interfaces. The 'interfaces' command output provides a detailed view of the interfaces for each VRF, including their IP addresses, VRF assignments, and protocol status.

```
R3#show ip vrf brief
Name                Default RD      Interfaces

3 CONFIGURAR CAPA 2

En esta parte, tendrá que configurar los Switches para soportar la conectividad con los dispositivos finales.

Las tareas de configuración son las siguientes.

3.1 DESHABILITAR TODAS LAS INTERFACES DE LOS SWITCHES

Tabla 10 Tabla de tareas 3.1

Task	Specification
En D1, D2, y A1, deshabilitar todas las interfaces	

Tabla 11 Configuración para deshabilitar todas las interfaces en D1, D2 y A1

Command	Description
interface range “rango de interfaces”	Selecciona un rango de interfaces inicio-final, se pueden separar secciones utilizando comas
shutdown	Deshabilita una o varias interfaces seleccionadas previamente

Scripts para los dispositivos

```
D1, D2, A1
enable
configure terminal
interface range e1/0-3
shutdown
exit
interface range e2/0-3
shutdown
exit
interface range e3/0-3
shutdown
end
copy running-config startup-config
```

Figura 35 Configuración deshabilitar todas las interfaces D1

```
D1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D1(config)#interface range e1/0-3
D1(config-if-range)#shutdown
D1(config-if-range)#exit
D1(config)#interface range e2/0-3
D1(config-if-range)#shutdown
D1(config-if-range)#exit
D1(config)#interface range e3/0-3

3.4 CONFIGURAR ACCESS PORTS

Tabla 16 Tabla de tareas 3.4

Task	Specification
En D1, D2, y A1, configurar access ports para PC1, PC2, PC3, y PC4	Configurar y habilitar los Access ports como se indica: <ul style="list-style-type: none"> • En D1, configurar interface E0/3 modo access port en VLAN 13 y habilitar Portfast. • En D2, configurar interface E0/2 modo access port en VLAN 13 y habilitar Portfast. • En D2, configurar interface E0/1 modo access port en VLAN 8 y habilitar Portfast. • En A1, configurar interface E0/2 modo access port en VLAN 8 y habilitar Portfast.

Tabla 17 Configuración de access ports en D1, D2 y A1 para PC1, PC2, PC3, PC4

Command	Description
switchport mode access	Habilita el modo access al puerto seleccionado previamente
switchport access vlan "# id"	Habilita el acceso a una vlan en específico para el puerto seleccionado previamente
spanning-tree portfast	Habilita rapid spanning tree para el puerto seleccionado previamente

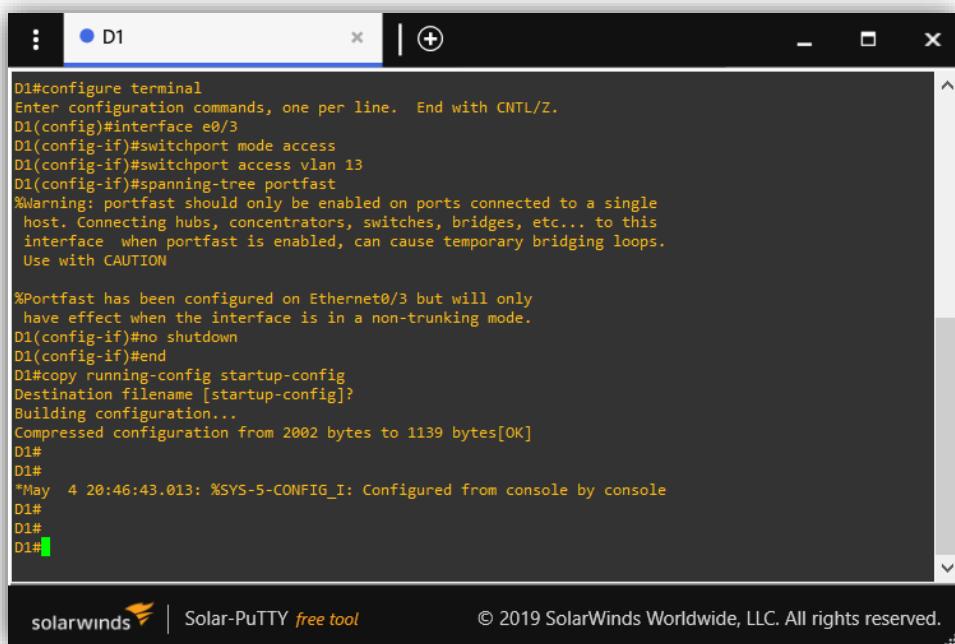

Scripts para los dispositivos

```
D1
enable
configure terminal
interface e0/3
switchport mode access
switchport access vlan 13
spanning-tree portfast
no shutdown
end
copy running-config startup-config
```

```
D2
enable
configure terminal
interface e0/2
switchport mode access
switchport access vlan 13
spanning-tree portfast
no shutdown
exit
interface e0/1
switchport mode access
switchport access vlan 8
spanning-tree portfast
no shutdown
end
copy running-config startup-config

A1
enable
configure terminal
interface e0/2
switchport mode access
switchport access vlan 8
spanning-tree portfast
no shutdown
end
copy running-config startup-config
```

The user is creating a new local user account named 'brandodiaz723' with privilege level 15 and a secret password. The command entered was 'username admin privilege 15 secret brandodiaz723'. The session then copies the running configuration to the startup configuration, which is then saved. The terminal also displays a timestamp: 'May 4 22:24:33.223: %SYS-5-CONFIG_I: Configured from console by console'. The Solar-PuTTY logo and copyright information for SolarWinds Worldwide, LLC (2019) are visible at the bottom.

CONCLUSIONES

Las configuraciones generales de los dispositivos permiten al administrador de la red tener un orden en la topología, conocer que medios de acceso a los dispositivos activos están permitidos, siendo este tipo de ajustes fáciles de replicar en múltiples dispositivos.

Con el uso de VRF, se logra una mayor eficiencia en el dispositivo, ya que en un único equipo se pueden crear múltiples instancias virtuales, disminuyendo los costos de hardware, interconexión e infraestructura.

La escalabilidad aumenta gracias a la creación de instancias virtuales, las cuales simplifican la expansión de la red.

La red es mucho más segura debido a la separación del tráfico, lograda por las distintas instancias virtuales, cada una con su propia tabla de enrutamiento y políticas de seguridad.

En las configuraciones de capa 2, redundancia y seguridad es indispensable como administrador de la red, evitar cualquier tipo de riesgo para la red, siendo este objetivo cumplido segmentando la red para usuarios especiales y finales en diferentes VLAN, también deshabilitando puertos de los dispositivos que no van a ser utilizados, configurando usuarios y contraseñas para el acceso a permisos privilegiados de configuración de los dispositivos, y preparando las conexiones de manera redundante, con el objetivo de dar fiabilidad, disponibilidad y seguridad.
