## **AGRADECIMIENTOS**

Primeramente, doy gracias a Dios, por la oportunidad de seguir construyendo aprendizaje por medio de la academia., así como también por la sabiduría y la fortaleza para culminar este proyecto.

A mi Familia, en especial a mi esposa, por su amor, y apoyo incondicional en esta trayectoria.

A mis hijos, por ser mi motivación para seguir superando mi rol profesional.

Tutores, equipo Docente, Gracias, por su dedicación, por hacer posible la transformación del conocimiento en aprendizaje y experiencias significativas, que enriquecen el saber profesional del futuro egresado, permitiendo ser competitivo en los entornos a desapañarse.

## GLOSARIO

**BGP:** Es un protocolo escalable de Dynamic routing usado en la Internet por grupos de enrutadores para compartir información de enrutamiento. BGP usa parámetros de ruta o atributos para definir políticas de enrutamiento y crear un entorno de enrutamiento estable. Ese protocolo permite que divulgue más de un camino hacia y desde la Internet a su red y recursos, lo que le ofrece caminos redundantes y puede aumentar su tiempo de actividad.

**ASN:** Un sistema autónomo se define como “un grupo de redes IP que poseen una política de rutas propia e independiente”. Esta definición hace referencia a la característica fundamental de un Sistema Autónomo: realiza su propia gestión del tráfico que fluye entre él y los restantes Sistemas Autónomos que forman Internet.

**HRSP:** El Hot Standby Router Protocol es un protocolo propiedad de CISCO que permite el despliegue de enrutadores redundantes tolerantes de fallos en una red. Este protocolo evita la existencia de puntos de fallo únicos en la red mediante técnicas de redundancia y comprobación del estado de los routers.

**VLAN:** Es un método para crear redes lógicas independientes dentro de una misma red física. Varias VLAN pueden coexistir en un único conmutador físico o en una única red física.

**PuTTY:** Es un cliente SSH, Telnet, rlogin, y TCP raw con licencia libre. Disponible originalmente solo para Windows, ahora también está disponible en varias plataformas Unix, y se está desarrollando la versión para Mac OS clásico y Mac OS.

**GNS3:** Es un simulador gráfico de red lanzado en 2008, que te permite diseñar topologías de red complejas y poner en marcha simulaciones sobre ellos, permitiendo la combinación de dispositivos tanto reales como virtuales.

**SWITCH:** Trabaja esencialmente en la capa 2 de una red OSI, el enlace de datos, y utiliza direcciones MAC sin utilizar direcciones IP. Por su parte, el routers lo hace en la capa 3 y se encarga del enrutamiento utilizando direcciones IP.

**RSTP:** Es un protocolo de red de la segunda capa OSI, que gestiona enlaces redundantes. Especificado en IEEE 802.1w, es una evolución del Spanning tree Protocol, reemplazándolo en la edición 2004 del 802.1d.

**LACP:** Es un término que indica el establecimiento de una red de datos que describe cómo utilizar varios enlaces Ethernet full-dúplex en la comunicación entre dos equipos, repartiendo el tráfico entre ellos.

## RESUMEN

Este documento está desarrollado en base a opción de grado de la facultad ingeniería electrónica, de la universidad abierta y a distancia.

Desarrollaremos las rutas del planteamiento para fortalecer habilidades y ejecutar las prácticas de habilidades CCNP, teniendo como escenario un protocolo de simulaciones que ejecutaremos gracias a las herramientas GNS3, donde plantearemos los montajes y la manipulación de las topologías utilizando el protocolo IOS de los dispositivos CISCO.

Los escenarios proponen, configurar un método de simulaciones de redes creando una topología de enrutamientos, esto va orientado a la programación del sistema de dispositivos existente en las actividades; en el laboratorio del escenarios, adoptaremos un planteamiento básico de conmutación de redes de programación, teniendo como adaptadores programables, como son; swicht, routers y PC, estos dispositivos en interconexiones crean un sistema electrónico de comunicación, implementando un conjunto de funcionalidades mediante interfaces del programa, esto nos da una solución de respuestas logrando proporcionar acceso de verificación, con el objetivo de monitorear el estado de ejecución y configuración del sistema.

Palabra clave: CCNP, GNS3, CISCO, conmutación, swicht, routers, PC.

## **ABSTRACT**

This document is developed based on the degree option of the electronic engineering faculty, of the open and distance university.

We will develop the routes of the approach to strengthen skills and execute the CCNP skills practices, taking as a scenario a simulation protocol that we will execute thanks to the GNS3 tools, where we will propose the assemblies and manipulation of the topologies using the IOS protocol of the CISCO devices.

The scenarios propose configuring a method of network simulations creating a routing topology, this is oriented to the programming of the existing device system in the activities; In the laboratory of the scenarios, we will adopt a basic exposition of commutation of programming networks, having as programmable adapters, as they are; switch, routers and PC, these devices in interconnections create an electronic communication system, implementing a set of functionalities through program interfaces, this gives us a response solution, managing to provide verification access, with the objective of monitoring the execution status and system configuration.

Keyword: CCNP, GNS3, CISCO, commutation, switch, routers, PC.

## INTRODUCCION

En el presente trabajo, desarrollaremos la actividad correspondiente al Diplomando Cisco CCNP, donde ejecutaremos la prueba de habilidades correspondiente al paso de prácticas de habilidad final del lineamiento del curso, este lleva como nombre; ENCOR Skills assessment (Escenario 1 y 2). Este escenario consta de una topología estructurada ya definida, permitiendo la comunicación de redes con los dispositivos a implementar, esta interacción de comunicación consta; routers, switch y PC; iniciaremos el paso a paso con la configuración de los programas o herramienta para trabajar en GNS3, implementaremos la metodología para la conmutación y enlace de los programas y sus diferentes interacciones, debemos crear en GNS3 una la máquina virtual, donde con ayudas de otros programas lograremos la ejecución el diseño de nuestra actividad.

En el siguiente paso implementaremos las configuraciones de las direcciones IP en cada uno de los dispositivos IPv4 y IPv6, desarrollaremos el cronograma de la experiencia instalando cada dispositivo y conmutando sus conexiones, manejando los protocolos de las diferentes características de cada uno de ellos, teniendo los enlaces de VLAN, LACP; OSPF, LAN y cada uno de los enrutamientos de BGP, para así ejecutar la experiencia práctica de habilidades.

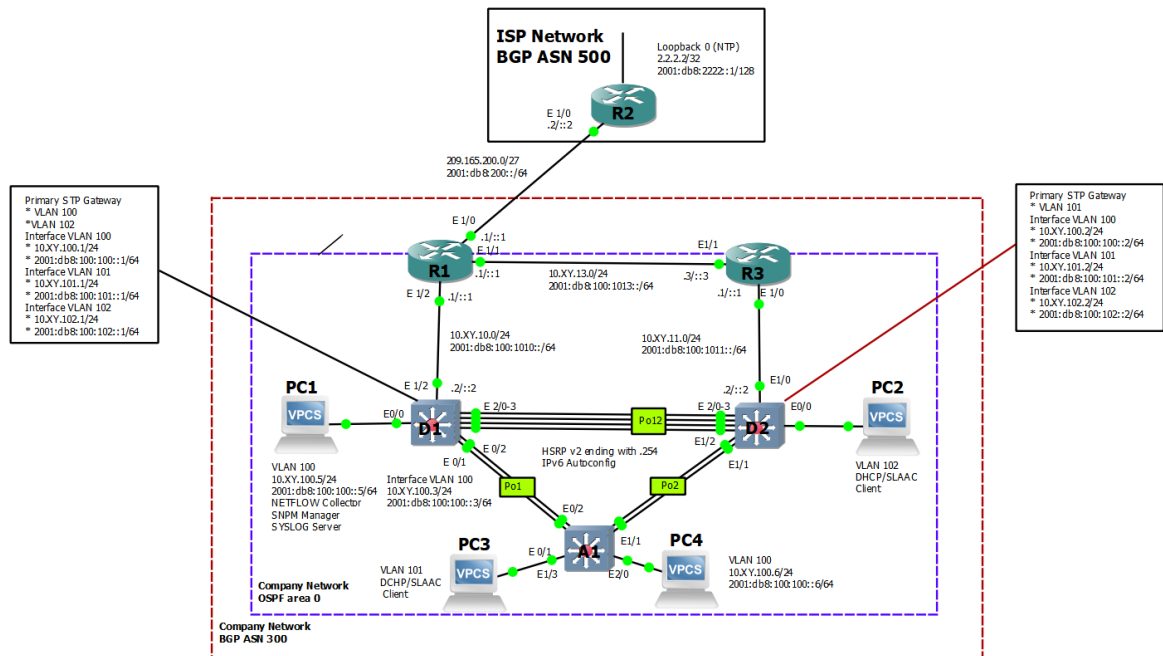

Por último, implementares las ejecución y verificación de los enlaces de cada uno de los dispositivos, donde nos muestra la respuesta en tiempo real, su funcionamiento y protocolo de respuesta del sistema de redes, esta experiencia corresponde a una serie de metodología interpuesta en toda la ejecución de la actividad de Cisco.

# PARTE 1: ENCOR Skills assessment (Escenario 1)

Fuente: Aplicación GNS3(Autoría propia)

Para realizar el montaje del Escenario 1 fue necesario el uso de GNS3 y la máquina virtual VM. En este caso se hizo uso de 3 Routers Cisco 7200 (R1, R2 Y R3) estos configurados previamente todos con Ethernet Adapters, 3 switches Cisco IOU L2 (D1, D2 Y A1) y 4 VPCS (PC1, PC2, PC3 Y PC4).

Una vez ubicado los elementos a usar se hicieron las respectivas conexiones teniendo en cuenta la Figura 1

Configure el direccionamiento de host de PC 1 y PC 4 como se muestra en la tabla de direccionamiento. Asigne una dirección de puerta de enlace predeterminada de 10.11.100.254, que será la dirección IP virtual de HSRP utilizada en la Parte 4.

Figura 27. direccionamiento del host PC1

```
PC1> ip 10.11.100.5/24 10.11.100.254
Checking for duplicate address...
PC1 : 10.11.100.5 255.255.255.0 gateway 10.11.100.254

PC1> save
Saving startup configuration to startup.vpc
. done
```

Figura 28. direccionamiento del host PC2

```
PC4> ip 10.11.100.6/24 10.11.100.254
Checking for duplicate address...
PC1 : 10.11.100.6 255.255.255.0 gateway 10.11.100.254

PC4> save
Saving startup configuration to startup.vpc
. done
```

El protocolo de los switch LAN es distribuir las tramas por medios de las capa 2, estos dispositivos ejecutan un host local de la red de ethernet. Las direcciones MAC del host que se verifican en red son asignado en esa direccion Mac a su propio puerto de switch Ethernet.

Configurar la red de capa 2 y la compatibilidad con el host, en esta parte de la evaluación de habilidades, completará la configuración de la red de capa 2 y configurará el soporte de host básico. Al final de esta parte, todos los interruptores deberían poder comunicarse. PC2 y PC3 deben recibir direccionamiento de DHCP y SLAAC, Sus tareas de configuración son las siguientes:

**2.1** On all switches, configure IEEE 802.1Q trunk interfaces on interconnecting switch links

Switch D1

configure terminal

interface range e2/0-3,e0/1-2

switchport trunk encapsulation dot1q

switchport mode trunk

no shutdown

exit

Figura 29. configuracion switch D1

```
D1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D1(config)#interface range e2/0-3,e0/1-2
D1(config-if-range)#switchport trunk encapsulation dot1q
D1(config-if-range)#switchport mode trunk
D1(config-if-range)#no shutdown
D1(config-if-range)#exit
```

Switch D2

configure terminal

interface range e2/0-3,e1/1-2

switchport trunk encapsulation dot1q

switchport mode trunk

no shutdown

exit

Figura 30. configuracion switch D2

```
D2#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D2(config)#interface range e2/0-3,e1/1-2
D2(config-if-range)#switchport trunk encapsulation dot1q
D2(config-if-range)#switchport mode trunk
D2(config-if-range)#no shutdown
D2(config-if-range)#exit
D2(config)#exit
```

### Switch A1

```
configure terminal
interface range e0/1-2,e1/1-2
switchport trunk encapsulation dot1q
switchport mode trunk
no shutdown
exit
```

Figura 31. configuracion switch A1

```
A1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
A1(config)#interface range e0/1-2,e1/1-2
A1(config-if-range)#switchport trunk encapsulation dot1q
A1(config-if-range)#switchport mode trunk
A1(config-if-range)#no shutdown
A1(config-if-range)#exit
A1(config)#exit
A1#
```

2.2 On all switches, change the native VLAN on trunk links.

### Switch D1

```
configure terminal
interface range e2/0-3,e0/1-2
switchport trunk native vlan 999
exit
```

Figura 32. configuracion VLAN switch D1

```
IOU1#show int trunk
Port      Mode      Encapsulation  Status      Native vlan
Et0/1     on        802.1q         trunking    1

### 2.3 On all switches, enable the Rapid Spanning-Tree Protocol.

#### Switch D1

configure terminal

Spanning-tree mode rapid-pvst

Exit

Figura 35. configuracion Spanning-Tree Protocol switch D1

```
D1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D1(config)#Spanning-tree mode rapid-pvst
D1(config)#exit
D1#
```

#### Switch D2

configure terminal

Spanning-tree mode rapid-pvst

Exit

Figura 36. configuracion Spanning-Tree Protocol switch D2

```
D2#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D2(config)#Spanning-tree mode rapid-pvst
D2(config)#exit
D2#
```

#### Switch A1

configure terminal

Spanning-tree mode rapid-pvst

Exit

Figura 37. configuracion Spanning-Tree Protocol switch A1

```
A1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
A1(config)#Spanning-tree mode rapid-pvst
A1(config)#exit
A1#
```

**2.4** On D1 and D2, configure the appropriate RSTP root bridges based on the information in the topology diagram.

D1 and D2 must provide backup in case of root bridge failure.

Switch D1

```
configure terminal
spanning-tree vlan 100,102 root primary
spanning-tree vlan 101 root secondary
exit
```

Figura 38. configuracion RSTP switch D1

```
D1#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D1(config)#spanning-tree vlan 100,102 root primary
D1(config)#spanning-tree vlan 101 root secondary
D1(config)#exit
```

Switch D2

```
configure terminal
spanning-tree vlan 101,100 root primary
spanning-tree vlan 102 root secondary
exit
```

Figura 39. configuracion RSTP switch D2

```
D2#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
D2(config)#spanning-tree vlan 101,100 root primary

## ENCOR Skills Assessment (scenario 2)

Continuación del escenario #1

Figura #51 topología del escenario #2

### Configure Routing Protocols

In this part, you will configure IPv4 and IPv6 routing protocols. At the end of this part, the network should be fully converged. IPv4 and IPv6 pings to the Loopback 0 interface from D1 and D2 should be successful.

**Note:** Pings from the hosts will not be successful because their default gateways are pointing to the HSRP address which will be enabled in Part 4.

Your configuration tasks are as follows:

Task#	Task	Specification	Points
3.1	On the “Company Network” (i.e., R1, R3, D1, and D2), configure single-area OSPFv2 in area 0.	<p>Use OSPF Process ID 4 and assign the following router-IDs:</p> <ul style="list-style-type: none"> <li>• R1: 0.0.4.1</li> <li>• R3: 0.0.4.3</li> <li>• D1: 0.0.4.131</li> <li>• D2: 0.0.4.132</li> </ul> <p>On R1, R3, D1, and D2, advertise all directly connected networks / VLANs in Area 0.</p> <ul style="list-style-type: none"> <li>• On R1, do not advertise the R1 – R2 network.</li> <li>• On R1, propagate a default route. Note that the default route will be provided by BGP.</li> </ul> <p>Disable OSPFv2 advertisements on:</p> <ul style="list-style-type: none"> <li>• D1: All interfaces except E1/2</li> <li>• D2: All interfaces except E1/0</li> </ul>	8

Task#	Task	Specification	Points
3.2	On the “Company Network” (i.e., R1, R3, D1, and D2), configure classic single-area OSPFv3 in area 0.	<p>Use OSPF Process ID <b>6</b> and assign the following router-IDs:</p> <ul style="list-style-type: none"> <li>• R1: 0.0.6.1</li> <li>• R3: 0.0.6.3</li> <li>• D1: 0.0.6.131</li> <li>• D2: 0.0.6.132</li> </ul> <p>On R1, R3, D1, and D2, advertise all directly connected networks / VLANs in Area 0.</p> <ul style="list-style-type: none"> <li>• On R1, do not advertise the R1 – R2 network.</li> <li>• On R1, propagate a default route. Note that the default route will be provided by BGP.</li> </ul> <p>Disable OSPFv3 advertisements on:</p> <ul style="list-style-type: none"> <li>• D1: All interfaces except E1/2</li> <li>• D2: All interfaces except E1/0</li> </ul>	8

Task#	Task	Specification	Points
3.3	On R2 in the “ISP Network”, configure MP-BGP.	<p>Configure two default static routes via interface Loopback 0:</p> <ul style="list-style-type: none"> <li>• An IPv4 default static route.</li> <li>• An IPv6 default static route.</li> </ul> <p>Configure R2 in BGP ASN <b>500</b> and use the router-id 2.2.2.2.</p> <p>Configure and enable an IPv4 and IPv6 neighbor relationship with R1 in ASN 300.</p> <p>In IPv4 address family, advertise:</p> <ul style="list-style-type: none"> <li>• The Loopback 0 IPv4 network (/32).</li> <li>• The default route (0.0.0.0/0).</li> </ul> <p>In IPv6 address family, advertise:</p> <ul style="list-style-type: none"> <li>• The Loopback 0 IPv4 network (/128).</li> <li>• The default route (::/0).</li> </ul>	4

Task#	Task	Specification	Points
3.4	On R1 in the "ISP Network", configure MP-BGP.	<p>Configure two static summary routes to interface Null 0:</p> <ul style="list-style-type: none"> <li>• A summary IPv4 route for 10.11.0.0/8.</li> <li>• A summary IPv6 route for 2001:db8:100::/48.</li> </ul> <p>Configure R1 in BGP ASN <b>300</b> and use the router-id 1.1.1.1.</p> <p>Configure an IPv4 and IPv6 neighbor relationship with R2 in ASN 500.</p> <p>In IPv4 address family:</p> <ul style="list-style-type: none"> <li>• Disable the IPv6 neighbor relationship.</li> <li>• Enable the IPv4 neighbor relationship.</li> <li>• Advertise the 10.11.0.0/8 network.</li> </ul> <p>In IPv6 address family:</p> <ul style="list-style-type: none"> <li>• Disable the IPv4 neighbor relationship.</li> <li>• Enable the IPv6 neighbor relationship.</li> <li>• Advertise the 2001:db8:100::/48 network.</li> </ul>	4

**3.1** En la "Red de la empresa" (es decir, R1, R3, D1 y D2), configure OSPFv2 de área única en el área 0.

Routers 1

R1(config)#router ospf 4

R1(config-router)#router-id 0.0.4.1

R1(config-router)#network 10.11.10.0 0.0.0.255 area 0

## CONCLUSIONES

Implementamos el escenario y protocolo propuesto en la topología de la actividad de curso de profundización Cisco CCNP, utilizando las configuraciones LACP y el manejo teórico de la diferentes switch y sus características principales en la visión de instarla el diseño del que corresponde por capa 2 y 3. La plataforma Cisco es una estructura académica de redes, donde tiene como modelo las representaciones gráficas y programable de las configuración de los dispositivo de redes, teniendo como principal característica el estado de tiempo de ejecución de la topología, enlazando y analizando los componentes de software y hardware.

En este orden de idea, implementamos una topología escenario uno donde ejecutamos una tabla de direcciones para enlazar los diferentes dispositivos y realizar una conmutación con repuesta; BGP, ASN, HRSP, VLAN, IP SLA, HSRPv2, etc. De acuerdo a los pasos implementamos, los protocolos de enrutamiento se guardaron en cada uno de sus sistemas de programación interna con la configuración el modelo copy running-config startup-config, es la abreviatura de copy run start. Esto permite copiar la configuración activa del routers de la RAM a la NVRAM.

Ejecutamos y realizamos verificación de la configuración de red de capa 2 y la compatibilidad con el host, en esta parte de la evaluación de habilidades, completará la configuración de la red de capa 2 y configurará el soporte de host básico. Al final de esta parte, todos los interruptores deberían poder comunicarse. PC2 y PC3 deben recibir direccionamiento de DHCP y SLAAC, en el protocolo de la actividad nos muestra la implementación y la respuesta satisfactoria de cada ping y del diseño ejecutable final.
