Introducción

El presente trabajo tiene como fin recopilar las habilidades logradas en el desarrollo del curso sobre la configuración, administración, seguridad y escalabilidad de redes conmutadas mediante switches y routers, esto a través del desarrollo de 3 escenarios prácticos correspondientes a la Prueba de Habilidades CCNP de la actividad de evaluacion final del diplomado de profundización cisco CCNP.

Los temas que se abordan para el desarrollo de los laboratorios son: en el escenario 1 los protocolos de enrutamiento entre áreas de OSPF y EIGRP y la distribución de rutas entre ambos protocolos, en el escenario 2 la interconexión de redes mediante el protocolo BGP y la creación de vecinos según diferentes criterios, por ultimo en el escenario 3, la configuración del protocolo troncal VLAN, VTP, así como el enrutamiento IP e InterVLAN. Al final se espera adquirir las habilidades y competencias necesarias para la implementación de una red tipo campus según las competencias proyectadas para el final del curso.

Descripción de escenarios propuestos para la prueba de habilidades

Escenario 1

1. Aplique las configuraciones iniciales y los protocolos de enrutamiento para los routers R1, R2, R3, R4 y R5 según el diagrama. No asigne passwords en los routers. Configurar las interfaces con las direcciones que se muestran en la topología de red.
2. Cree cuatro nuevas interfaces de Loopback en R1 utilizando la asignación de direcciones 10.1.0.0/22 y configure esas interfaces para participar en el área 0 de OSPF.
3. Cree cuatro nuevas interfaces de Loopback en R5 utilizando la asignación de direcciones 172.5.0.0/22 y configure esas interfaces para participar en el Sistema Autónomo EIGRP 10.
4. Analice la tabla de enrutamiento de R3 y verifique que R3 está aprendiendo las nuevas interfaces de Loopback mediante el comando **show ip route**.

5. Configure R3 para redistribuir las rutas EIGRP en OSPF usando el costo de 50000 y luego redistribuya las rutas OSPF en EIGRP usando un ancho de banda T1 y 20,000 microsegundos de retardo.
6. Verifique en R1 y R5 que las rutas del sistema autónomo opuesto existen en su tabla de enrutamiento mediante el comando **show ip route**.

DESARROLLO

1. Aplique las configuraciones iniciales y los protocolos de enrutamiento para los routers R1, R2, R3, R4 y R5 según el diagrama. No asigne passwords en los routers. Configurar las interfaces con las direcciones que se muestran en la topología de red

R1

```
R1(config)#interface s0/0/0
R1(config-if)#bandwidth 128000
R1(config-if)#ip address 10.103.12.10 255.255.255.0
R1(config-if)#no shutdown
R1(config-if)#exit
R1(config)#router ospf 1
R1(config-router)#network 10.103.12.0 0.0.0.255 area 0
```

R2

```
R2(config)#interface s0/0/0
R2(config-if)#ip address 10.103.12.20 255.255.255.0
R2(config-if)#no shutdown
R2(config-if)#interface s0/0/1
R2(config-if)#ip address 10.103.23.20 255.255.255.0
R2(config-if)#no shutdown
R2(config-if)#exit
R2(config)#router ospf 1
R2(config-router)#network 10.103.12.0 0.0.0.255 area 0
R2(config-router)#
00:06:19: %OSPF-5-ADJCHG: Process 1, Nbr 10.103.12.10 on Serial0/0/0
R2(config-router)#network 10.103.23.0 0.0.0.255 area 0
```

R3

```
R3(config)#interface s0/0/1
R3(config-if)#bandwidth 128000
R3(config-if)#ip address 10.103.23.10 255.255.255.0
R3(config-if)#no shutdown
R3(config-if)#int s0/0/0
R3(config-if)#ip address 172.29.34.10 255.255.255.0
R3(config-if)#no shutdown
R3(config-if)#exit
R3(config)#router ospf 1
R3(config-router)#network 10.103.23.0 0.0.0.255 area 0
R3(config-router)#
00:20:03: %OSPF-5-ADJCHG: Process 1, Nbr 10.103.23.20 on Serial0/0/1 from
LOADING to FULL, Loading Done
R3(config-router)#exit
R3(config)#router eigrp 10
R3(config-router)#network 172.29.34.0 0.0.0.255
```

R4

```
R4(config)#interface s0/0/0
R4(config-if)#ip address 172.29.34.20 255.255.255.0
R4(config-if)#no shutdown
R4(config-if)#interface s0/0/1
R4(config-if)#ip address 172.29.45.20 255.255.255.0
R4(config-if)#no shutdown
R4(config-if)#exit
R4(config)#router eigrp 10
R4(config-router)#network 172.29.34.0 0.0.0.255
R4(config-if)#
%DUAL-5-NBRCHANGE: IP-EIGRP 10: Neighbor 172.29.34.10 (Serial0/0/0) is up:
new adjacency
R4(config-router)#network 172.29.45.0 0.0.0.255
```

R5

```
R5(config)#interface s0/0/1
R5(config-if)#bandwidth 128000
R5(config-if)#ip address 172.29.45.10 255.255.255.0
R5(config-if)#no shutdown
R5(config-if)#exit
R5(config)#router eigrp 10
R5(config-router)#network 172.29.45.0 0.0.0.255
```

```
R5(config-router)#
%DUAL-5-NBRCHANGE: IP-EIGRP 10: Neighbor 172.29.45.20 (Serial0/0/1) is up:
new adjacency
```

2. Cree cuatro nuevas interfaces de Loopback en R1 utilizando la asignación de direcciones 10.1.0.0/22 y configure esas interfaces para participar en el área 0 de OSPF.

LISTADO DE SUBREDES		
RED	RANGO HOSTS	BROADCAST
10.1.0.0/24	10.1.0.1 -- 10.1.0.254	10.1.0.255
10.1.1.0/24	10.1.1.1 -- 10.1.1.254	10.1.1.255
10.1.2.0/24	10.1.2.1 -- 10.1.2.254	10.1.2.255

	S 0/0	192.1.34.3	255.255.255.0

	Interfaz	Dirección IP	Máscara
R4	Loopback 0	4.4.4.4	255.0.0.0
	Loopback 1	14.1.0.1	255.255.0.0
	S 0/0	192.1.34.4	255.255.255.0

- Configure una relación de vecino BGP entre R1 y R2. R1 debe estar en **AS1** y R2 debe estar en **AS2**. Anuncie las direcciones de Loopback en BGP. Codifique los ID para los routers BGP como 11.11.11.11 para R1 y como 22.22.22.22 para R2. Presente el paso a con los comandos utilizados y la salida del comando **show ip route**.
- Configure una relación de vecino BGP entre R2 y R3. R2 ya debería estar configurado en **AS2** y R3 debería estar en **AS3**. Anuncie las direcciones de Loopback de R3 en BGP. Codifique el ID del router R3 como 33.33.33.33. Presente el paso a con los comandos utilizados y la salida del comando **show ip route**.
- Configure una relación de vecino BGP entre R3 y R4. R3 ya debería estar configurado en **AS3** y R4 debería estar en **AS4**. Anuncie las direcciones de Loopback de R4 en BGP. Codifique el ID del router R4 como 44.44.44.44. Establezca las relaciones de vecino con base en las direcciones de Loopback 0. Cree rutas estáticas para alcanzar la Loopback 0 del otro router. No anuncie la Loopback 0 en BGP. Anuncie la red Loopback de R4 en BGP. Presente el paso a con los comandos utilizados y la salida del comando **show ip route**.

DESARROLLO

- Configure una relación de vecino BGP entre R1 y R2. R1 debe estar en **AS1** y R2 debe estar en **AS2**. Anuncie las direcciones de Loopback en BGP. Codifique los ID para los routers BGP como 11.11.11.11 para R1 y como 22.22.22.22 para R2. Presente el paso a con los comandos utilizados y la salida del comando **show ip route**.

Escenario 3

A. Configurar VTP

1. Todos los switches se configurarán para usar VTP para las actualizaciones de VLAN. El switch SWT2 se configurará como el servidor. Los switches SWT1 y SWT3 se configurarán como clientes. Los switches estarán en el dominio VPT llamado CCNP y usando la contraseña cisco.

SWT2

```
SWT2(config)# vtp mode server  
Setting device to VTP SERVER mode.  
SWT2 (config)#vtp domain CCNP  
Changing VTP domain name from NULL to CCNP  
SWT2 (config)#vtp password cisco  
Setting device VLAN database password to cisco
```

SWT1

```
SWT1(config)# vtp mode client  
Setting device to VTP CLIENT mode.  
SWT1(config)# vtp domain CCNP  
Changing VTP domain name from NULL to CCNP  
SWT1(config)#vtp password cisco  
Setting device VLAN database password to cisco
```

SWT3

```
SWT3(config)# vtp mode client  
Setting device to VTP CLIENT mode.  
SWT3(config)#vtp domain CCNP  
Changing VTP domain name from NULL to CCNP  
SWT3(config)#vtp password cisco  
Setting device VLAN database password to cisco
```

2. Verifique las configuraciones mediante el comando **show vtp status**.

En SWT2

```
SWT2#show vtp status  
VTP Version : 2  
Configuration Revision : 0  
Maximum VLANs supported locally : 255  
Number of existing VLANs : 5  
VTP Operating Mode : Server  
VTP Domain Name : CCNP
```

En SWT1

```
SWT1#show vtp status  
VTP Version : 2  
Configuration Revision : 0  
Maximum VLANs supported locally : 255  
Number of existing VLANs : 5  
VTP Operating Mode : Client  
VTP Domain Name : CCNP
```

En SWT3

```
SWT3#show vtp status  
VTP Version : 2  
Configuration Revision : 0  
Maximum VLANs supported locally : 255  
Number of existing VLANs : 5  
VTP Operating Mode : Client  
VTP Domain Name : CCNP
```

B. Configurar DTP (Dynamic Trunking Protocol)

- Configure un enlace troncal ("trunk") dinámico entre SWT1 y SWT2. Debido a que el modo por defecto es **dynamic auto**, solo un lado del enlace debe configurarse como **dynamic desirable**.

SWT1

```
SWT1(config)#interface f0/1  
SWT1(config-if)#switchport mode dynamic desirable
```

En SWT1

```
SWT1#show interfaces f0/1 switchport  
Name: Fa0/1  
Switchport: Enabled  
Administrative Mode: dynamic desirable  
Operational Mode: trunk
```

En SWT2

```
SWT2#show interfaces f0/1 switchport  
Name: Fa0/1  
Switchport: Enabled  
Administrative Mode: dynamic auto  
Operational Mode: trunk
```

- Verifique el enlace "trunk" entre SWT1 y SWT2 usando el comando **show interfaces trunk**.

En SWT1

```
SWT1#show interfaces trunk  
Port      Mode      Encapsulation  Status      Native vlan  
Fa0/1    desirable     n-802.1q       trunking       1  
  
Port      Vlans allowed on trunk  
Fa0/1        1-1005  
  
Port      Vlans allowed and active in management domain  
Fa0/1          1  
  
Port      Vlans in spanning tree forwarding state and not pruned  
Fa0/1          1
```

En SWT2

```
SWT2#show interfaces trunk
Port      Mode          Encapsulation  Status       Native vlan
Fa0/1    auto          n-802.1q        trunking    1

Port      Vlans allowed on trunk
Fa0/1    1-1005

Port      Vlans allowed and active in management domain
Fa0/1    1

Port      Vlans in spanning tree forwarding state and not pruned
Fa0/1    1
```

3. Entre SWT1 y SWT3 configure un enlace "trunk" estático utilizando el comando **switchport mode trunk** en la interfaz F0/3 de SWT1

SWT1

```
SWT1(config)#interface f0/3
SWT1(config-if)#switchport mode trunk
```

4. Verifique el enlace "trunk" el comando **show interfaces trunk** en SWT1.

En SWT1

```
SWT1#show interfaces trunk
Port      Mode          Encapsulation  Status       Native vlan
Fa0/1    desirable    n-802.1q        trunking    1
Fa0/3    on           802.1q         trunking    1

Port      Vlans allowed on trunk
Fa0/1    1-1005
Fa0/3    1-1005

Port      Vlans allowed and active in management domain
Fa0/1    1
Fa0/3    1

Port      Vlans in spanning tree forwarding state and not pruned
Fa0/1    1
Fa0/3    1
```

En SWT3

```
SWT3#show interfaces trunk
Port      Mode          Encapsulation  Status       Native vlan
Fa0/3    auto          n-802.1q        trunking    1

Port      Vlans allowed on trunk
Fa0/3    1-1005

Port      Vlans allowed and active in management domain
Fa0/3    1

Port      Vlans in spanning tree forwarding state and not pruned
Fa0/3    1
```

- Configure un enlace "trunk" permanente entre SWT2 y SWT3.

SWT2

```
SWT2(config)#int f0/3  
SWT2(config-if)#switchport mode trunk
```

En SWT2

```
SWT2#show interfaces trunk  
Port      Mode       Encapsulation  Status      Native vlan  
Fa0/1    auto       n-802.1q      trunking    1  
Fa0/3    on         802.1q       trunking    1  
  
Port      Vlans allowed on trunk  
Fa0/1    1-1005  
Fa0/3    1-1005  
  
Port      Vlans allowed and active in management domain  
Fa0/1    1  
Fa0/3    1  
  
Port      Vlans in spanning tree forwarding state and not pruned  
Fa0/1    1  
Fa0/3    none
```

En SWT3

```
SWT3#show interfaces trunk  
Port      Mode       Encapsulation  Status      Native vlan  
Fa0/1    auto       n-802.1q      trunking    1  
Fa0/3    auto       n-802.1q      trunking    1  
  
Port      Vlans allowed on trunk  
Fa0/1    1-1005  
Fa0/3    1-1005  
  
Port      Vlans allowed and active in management domain  
Fa0/1    1  
Fa0/3    1  
  
Port      Vlans in spanning tree forwarding state and not pruned  
Fa0/1    1  
Fa0/3    1
```

C. Agregar VLANs y asignar puertos.

- En STW1 agregue la VLAN 10. En STW2 agregue las VLANS Compras (10), Mercadeo (20), Planta (30) y Admon (99)

SWT1

```
SWT1(config)#vlan 10  
VTP VLAN configuration not allowed when device is in CLIENT mode.
```

SWT2

```
SWT2(config)#vlan 10
SWT2(config-vlan)#name Compras
SWT2(config-vlan)#vlan 20
SWT2(config-vlan)#name Mercadeo
SWT2(config-vlan)#vlan 30
SWT2(config-vlan)#name Planta
SWT2(config-vlan)#vlan 99
SWT2(config-vlan)#name Administracion
```

2. Verifique que las VLANs han sido agregadas correctamente.

En SWT1

SWT1#show vlan brief			
VLAN	Name	Status	Ports
1	default	active	Fa0/2, Fa0/4, Fa0/5, Fa0/6 Fa0/7, Fa0/8, Fa0/9, Fa0/10 Fa0/11, Fa0/12, Fa0/13, Fa0/14 Fa0/15, Fa0/16, Fa0/17, Fa0/18 Fa0/19, Fa0/20, Fa0/21, Fa0/22 Fa0/23, Fa0/24, Gig0/1, Gig0/2
10	Compras	active	
20	Mercadeo	active	
30	Planta	active	
99	Administracion	active	
1002	fddi-default	active	
1003	token-ring-default	active	
1004	fddinet-default	active	
1005	trnet-default	active	

En SWT2

SWT2#show vlan brief			
VLAN	Name	Status	Ports
1	default	active	Fa0/2, Fa0/4, Fa0/5, Fa0/6 Fa0/7, Fa0/8, Fa0/9, Fa0/10 Fa0/11, Fa0/12, Fa0/13, Fa0/14 Fa0/15, Fa0/16, Fa0/17, Fa0/18 Fa0/19, Fa0/20, Fa0/21, Fa0/22 Fa0/23, Fa0/24, Gig0/1, Gig0/2
10	Compras	active	
20	Mercadeo	active	
30	Planta	active	
99	Administracion	active	
1002	fddi-default	active	
1003	token-ring-default	active	
1004	fddinet-default	active	
1005	trnet-default	active	

En SWT3

SWT3#show vlan brief		
VLAN Name	Status	Ports
1 default	active	Fa0/2, Fa0/4, Fa0/5, Fa0/6 Fa0/7, Fa0/8, Fa0/9, Fa0/10 Fa0/11, Fa0/12, Fa0/13, Fa0/14 Fa0/15, Fa0/16, Fa0/17, Fa0/18 Fa0/19, Fa0/20, Fa0/21, Fa0/22 Fa0/23, Fa0/24, Gig0/1, Gig0/2
10 Compras	active	
20 Mercadeo	active	
30 Planta	active	
99 Administracion	active	
1002 fddi-default	active	
1003 token-ring-default	active	
1004 fddinet-default	active	
1005 trnet-default	active	

3. Asocie los puertos a las VLAN y configure las direcciones IP de acuerdo con la siguiente tabla.

Interfaz	VLAN	Direcciones IP de los PCs
F0/10	VLAN 10	190.108.10.X / 24
F0/15	VLAN 20	190.108.20.X /24
F0/20	VLAN 30	190.108.30.X /24

X = número de cada PC particular

PC	Direcciones IP
PC1	190.108.10.1 / 24
PC2	190.108.20.1 / 24
PC3	190.108.30.1 / 24
PC4	190.108.10.2 / 24
PC5	190.108.20.2 / 24
PC6	190.108.30.2 / 24
PC7	190.108.10.3 / 24
PC8	190.108.20.3 / 24
PC9	190.108.30.3 / 24

- Configure el puerto F0/10 en modo de acceso para SWT1, SWT2 y SWT3 y asígnelo a la VLAN 10.

SWT1

```
SWT1(config)#interface f0/10  
SWT1(config-if)#switchport mode access  
SWT1(config-if)#switchport access vlan 10
```

SWT2

```
SWT2(config)#interface f0/10  
SWT2(config-if)#switchport mode access  
SWT2(config-if)#switchport access vlan 10
```

SWT3

```
SWT3(config)#interface f0/10  
SWT3(config-if)#switchport mode access  
SWT3(config-if)#switchport access vlan 10
```

- Repita el procedimiento para los puertos F0/15 y F0/20 en SWT1, SWT2 y SWT3. Asigne las VLANs y las direcciones IP de los PCs de acuerdo con la tabla de arriba.

SWT1

```
SWT1(config)#interface f0/15  
SWT1(config-if)#switchport mode access  
SWT1(config-if)#switchport access vlan 20  
SWT1(config)#interface f0/20  
SWT1(config-if)#switchport mode access  
SWT1(config-if)#switchport access vlan 30
```

SWT2

```
SWT2(config)#interface f0/15  
SWT2(config-if)#switchport mode access  
SWT2(config-if)#switchport access vlan 20  
SWT2(config)#interface f0/20  
SWT2(config-if)#switchport mode access  
SWT2(config-if)#switchport access vlan 30
```

SWT3

```
SWT3(config)#interface f0/15  
SWT3(config-if)#switchport mode access  
SWT3(config-if)#switchport access vlan 20  
SWT3(config)#interface f0/20  
SWT3(config-if)#switchport mode access  
SWT3(config-if)#switchport access vlan 30
```

D. Configurar las direcciones IP en los Switches.

1. En cada uno de los Switches asigne una dirección IP al SVI (*Switch Virtual Interface*) para VLAN 99 de acuerdo con la siguiente tabla de direccionamiento y active la interfaz.

Equipo	Interfaz	Dirección IP	Máscara
SWT1	VLAN 99	190.108.99.1	255.255.255.0
SWT2	VLAN 99	190.108.99.2	255.255.255.0
SWT3	VLAN 99	190.108.99.3	255.255.255.0

SWT1

```
SWT1(config)#interface vlan 99
SWT1(config-if)#ip address 190.108.99.1 255.255.255.0
```

SWT2

```
SWT2(config)#interface vlan 99
SWT2(config-if)#ip address 190.108.99.2 255.255.255.0
```

SWT3

```
SWT3(config)#interface vlan 99
SWT3(config-if)#ip address 190.108.99.3 255.255.255.0
```

En SWT1

```
interface Vlan99
mac-address 0003.e443.bb01
ip address 190.108.99.1 255.255.255.0
```

En SWT2

```
interface Vlan99
mac-address 00d0.9754.7601
ip address 190.108.99.2 255.255.255.0
```

En SWT3

```
interface Vlan99
mac-address 0004.9a84.7101
ip address 190.108.99.3 255.255.255.0
```

E. Verificar la conectividad Extremo a Extremo

1. Ejecute un Ping desde cada PC a los demás. Explique por qué el ping tuvo o no tuvo éxito.

En PC1

```
Command Prompt

C:\>ping 190.108.20.1
Pinging 190.108.20.1 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 190.108.20.1:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
C:\>ping 190.108.30.1
Pinging 190.108.30.1 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 190.108.30.1:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

```
Command Prompt

C:\>ping 190.108.10.2
Pinging 190.108.10.2 with 32 bytes of data:
Reply from 190.108.10.2: bytes=32 time=21ms TTL=128
Reply from 190.108.10.2: bytes=32 time<1ms TTL=128
Reply from 190.108.10.2: bytes=32 time<1ms TTL=128
Reply from 190.108.10.2: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.10.2:
  Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
  Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 21ms, Average = 5ms
C:\>ping 190.108.10.3
Pinging 190.108.10.3 with 32 bytes of data:
Reply from 190.108.10.3: bytes=32 time=1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128
Reply from 190.108.10.3: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.10.3:
  Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
  Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

En PC5

```
Command Prompt

C:\>ping 190.108.10.2
Pinging 190.108.10.2 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 190.108.10.2:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
C:\>ping 190.108.30.2
Pinging 190.108.30.2 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 190.108.30.2:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

```

Command Prompt
C:\>ping 190.108.20.1
Pinging 190.108.20.1 with 32 bytes of data:
Reply from 190.108.20.1: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.20.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>ping 190.108.20.3
Pinging 190.108.20.3 with 32 bytes of data:
Reply from 190.108.20.3: bytes=32 time<1ms TTL=128
Reply from 190.108.20.3: bytes=32 time<1ms TTL=128
Reply from 190.108.20.3: bytes=32 time=<1ms TTL=128
Reply from 190.108.20.3: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.20.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms

```

En PC9

```

Command Prompt
C:\>ping 190.108.10.3
Pinging 190.108.10.3 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 190.108.10.3:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
C:\>ping 190.108.20.3
Pinging 190.108.20.3 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 190.108.20.3:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

```

```

Command Prompt
C:\>ping 190.108.30.1
Pinging 190.108.30.1 with 32 bytes of data:
Reply from 190.108.30.1: bytes=32 time<1ms TTL=128

Ping statistics for 190.108.30.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>ping 190.108.30.2
Pinging 190.108.30.2 with 32 bytes of data:
Reply from 190.108.30.2: bytes=32 time<1ms TTL=128
Reply from 190.108.30.2: bytes=32 time<1ms TTL=128
Reply from 190.108.30.2: bytes=32 time<1ms TTL=128
Reply from 190.108.30.2: bytes=32 time=3ms TTL=128

Ping statistics for 190.108.30.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 3ms, Average = 0ms

```

Como se ve en las salidas del command prompt los pings a los PC que pertenecen a redes y VLAN diferentes no son exitoso, los pings a los PC que pertenecen a la misma red y VLAN si son exitosos. Esto pasa porque los switches capa 2 no pueden hacer ruteo InterVLAN, se necesita un router que interconecte las diferentes redes.

2. Ejecute un Ping desde cada Switch a los demás. Explique por qué el ping tuvo o no tuvo éxito.

En SWT3

```
SWT1#ping 190.108.99.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.99.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/0/1 ms

SWT1#ping 190.108.99.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.99.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/2/13 ms
```

En SWT2

```
SWT2#ping 190.108.99.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.99.1, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/0/0 ms

SWT2#ping 190.108.99.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.99.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/0/1 ms
```

En SWT3

```
SWT3#ping 190.108.99.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.99.1, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/1/3 ms

SWT3#ping 190.108.99.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.99.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 0/0/1 ms
```

Los pings a los Switches fueron todos exitosos, esto gracias a que se configuraron las interfaces que los comunican como enlaces troncales, estáticos entre SWT1 y SWT3 y entre SWT2 Y SWT3. Y en modo auto y deseable para SWT1 y SWT2.

3. Ejecute un Ping desde cada Switch a cada PC. Explique por qué el ping tuvo o no tuvo éxito.

En SWT1

```
SWT1#ping 190.108.10.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.10.1, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)

SWT1#ping 190.108.20.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.20.1, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)

SWT1#ping 190.108.30.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.30.1, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)
```

En SWT2

```
SWT2#ping 190.108.10.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.10.2, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)

SWT2#ping 190.108.20.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.20.2, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)

SWT2#ping 190.108.30.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.30.2, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)
```

En SWT3

```
SWT3#ping 190.108.10.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.10.3, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)

SWT3#ping 190.108.20.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.20.3, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)

SWT3#ping 190.108.30.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 190.108.30.3, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)
```

Los ping a los PC desde los switch no fueron exitosos porque las interfaces VLAN no tienen configurado ningun direccionamiento IP que las comuniquen con los PC.

Conclusiones

- El protocolo del camino más corto primero (OSPF) utiliza el algoritmo Dijkstra para encontrar la mejor ruta hacia la red destino. Su métrica es el Cost y utiliza como variable el Bandwidth. OSPF es un protocolo Classless, lo que significa que soporta VLSM y CIDR. A diferencia de EIGRP, incluye el concepto de Área el cual sólo se aplica a routers y para este trabajo se refiere a un conjunto de redes inmediatas identificadas por la misma área ID.
- El Protocolo de enrutamiento de pasarela interior mejorado (EIGRP) es un protocolo de pasarela interior adecuado para muchas topologías y medios diferentes. EIGRP se escala bien y proporciona tiempos de convergencia extremadamente rápidos con un tráfico de red mínimo. Se representa a la información de distancia en IGRP como un compuesto de ancho de banda disponible, demora, uso de carga y confiabilidad de link. Esto permite afinar las características del link para alcanzar trayectos óptimos.
- El Protocolo de puerta de enlace de frontera (BGP) utiliza TCP como protocolo de transporte, dos routers BGP forman una conexión TCP entre ellos y estos routers son “vecinos” que intercambian mensajes para abrir y confirmar los parámetros de conexión e información sobre la posibilidad de alcance de la red, creando trayectorias basadas en los números de AS BGP. Los vecinos BGP intercambian inicialmente las tablas de enrutamiento BGP completas, después de este intercambio, los routers vecinos envían actualizaciones graduales segun los cambios en sus tabla de enrutamiento.
- El VLAN Trunk Protocol (VTP) reduce la administración en una red de switches mediante la designación de un servidor VTP, al configurar una VLAN nueva en un servidor VTP, esta se distribuye a través de todos los switches que hacen parte del dominio, lo cual reduce la necesidad de configurar la misma VLAN en todos los dispositivos dela red.
