## **GLOSARIO**

**LOOPBACK:** La interfaz loopback es una interfaz lógica interna del router. Esta no se asigna a un puerto físico y, por lo tanto, nunca se puede conectar a otro dispositivo. Se la considera una interfaz de software que se coloca automáticamente en estado UP (activo), siempre que el router esté en funcionamiento (itesa , 2019).

**OSPF:**(Open Shortest Path First) es un protocolo de enrutamiento abierto del tipo Estado de Enlace (Link State). OSPF fue desarrollado por el IETF con el objetivo de reemplazar al protocolo RIP (Routing Information Protocol).

OSPF utiliza el algoritmo Dijkstra para encontrar la mejor ruta entre dos puntos. OSPF es un protocolo classless, por lo tanto, soporta VLSM y CIDR (DUARTE, 2019).

**EIGRP:** Es un protocolo de vector de distancias optimizado, que se basa en el Algoritmo de Actualización Difusa (DUAL) para calcular la trayectoria más corta hacia un destino dentro de una red (CISCO, 2020).

**BANDWIDTH :** Sirve solamente para indicar la velocidad de la interfaz a los protocolos de nivel superior. Por ejemplo, algunos protocolos de ruteo utilizan el ancho de banda como métrica para elegir la mejor ruta hacia la red de destino. Esta información la toman de los valores configurados para el parámetro bandwidth en cada interfaz. IGRP, EIGRP y OSPF utilizan la información de bandwidth (Gerometta, 2016).

## **RESUMEN**

El presente trabajo tiene como objetivo, la aplicación de los conocimientos recopilados a lo largo del desarrollo de los cursos propuestos en la plataforma CISCO y de esta misma forma desarrollar un aprendizaje centrado en la práctica. De igual manera la revisión y aplicación de conceptos de seguridad de redes, enrutamiento y commutación.

Para este fin se proponen dos escenarios de aplicación; en el primero encontramos el uso y aplicación en un ambiente simulado de los protocolos de EIGRP y OSPF, en el caso de OSPF este ha sido pensado para el entorno de Internet y su pila de protocolos TCP/IP, como un protocolo de routing interno, es decir, que distribuye información entre routers que pertenecen al mismo Sistema Autónomo mientras que EIGRP el cual es una versión mejorada de IGRP. La tecnología de vector de igual distancia que se usa en IGRP también se emplea en EIGRP. Además, la información de la distancia subyacente no presenta cambios mejorando de manera significativa la eficacia de las redes al ser escaladas.

En el segundo escenario desarrollado en este curso la situación planteada nos lleva a efectuar el desarrollo de redes VLAN con el fin de realizar la división de recursos de red en una organización mostrando las diferentes capacidades de este sistema de subredes, al poder limitar acceso a puertos específicos asignados a dichas VLANS siendo un diseño efectivo y sencillo de implementar sin llegar a afectar la arquitectura física de una red.

Palabras Clave: CISCO, CCNP, Commutación, Enrutamiento, Redes, Vlan, OSPF y EIGRP.

## **ABSTRACT**

The objective of this work is to apply the knowledge collected throughout the development of the courses proposed in the CISCO platform and in this same way develop a learning focused on practice. Likewise, the review and application of network security, routing and switching concepts.

For this purpose, two application scenarios are proposed; In the first we find the use and application in a simulated environment of the EIGRP and OSPF protocols, in the case of OSPF this has been designed for the Internet environment and its TCP / IP protocol stack, as an internal routing protocol, that is, it distributes information between routers that belong to the same Autonomous System while EIGRP which is an improved version of IGRP. The equal distance vector technology used in IGRP is also used in EIGRP. Furthermore, the underlying distance information does not show changes, significantly improving the efficiency of the networks when scaled.

In the second scenario developed in this course, the situation raised leads us to carry out the development of VLAN networks in order to divide network resources in an organization, showing the different capabilities of this subnet system, by limiting access to ports assigned to said VLANS, being an effective and simple design to implement without affecting the physical architecture of a network.

Keywords: CISCO, CCNP, Switching, Routing, Networks, Vlan, OSPF and EIGRP.

## **INTRODUCCIÓN**

El objetivo principal de la aplicación práctica de los conocimientos recopilados en el desarrollo de las diferentes etapas de este diplomado CCNP es del brindar las herramientas necesarias para la solución de problemas presentados en campo en la vida real pero con la ventaja de poder llevar a cabo su práctica en un ambiente controlado mediante el uso de software de simulación como lo son el GNS3, CISCO PACKET TRACER y SMARTLAB lo cual pedagógicamente nos lleva como estudiantes a una implementación de conocimientos mas dinámica.

Por lo tanto, con este afán pedagógico se nos presentan los dos escenarios a tratar en este trabajo los cuales involucran conocimientos sobre protocolos de enrutamiento, manejo de subredes y implementación de medidas de seguridad de redes abarcando al igual otras tantas habilidades recopiladas a través de los cursos de la arquitectura de CISCO.

Para el desarrollo y presentación de los resultados de la implementación de las soluciones a los escenarios se llevó a cabo desarrollo del código de configuración al igual que de la inclusión de imágenes y transcripciones del mismo con el afán de ayudar a comprender el proceso de solución.

## ESCENARIO 1

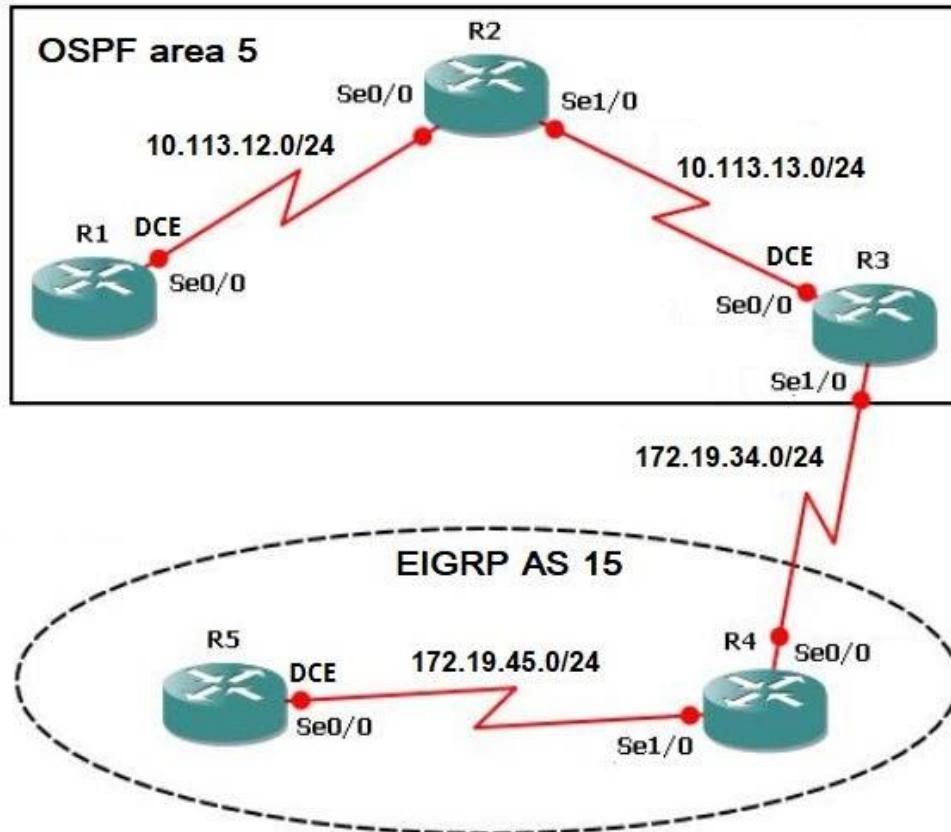

Ilustración 1 Escenario 1

1. Aplique las configuraciones iniciales y los protocolos de enrutamiento para los routers R1, R2, R3, R4 y R5 según el diagrama. No asigne passwords en los routers. Configurar las interfaces con las direcciones

que se muestran en la topología de red.

2. Cree cuatro nuevas interfaces de Loopback en R1 utilizando la asignación de direcciones 10.1.0.0/22 y configure esas interfaces para participar en el área 5 de OSPF.
3. Cree cuatro nuevas interfaces de Loopback en R5 utilizando la asignación de direcciones 172.5.0.0/22 y configure esas interfaces para participar en el Sistema Autónomo EIGRP 15.
4. Analice la tabla de enrutamiento de R3 y verifique que R3 está aprendiendo las nuevas interfaces de Loopback mediante el comando `show ip route`.
5. Configure R3 para redistribuir las rutas EIGRP en OSPF usando el costo de 50000 y luego redistribuya las rutas OSPF en EIGRP usando un ancho de banda T1 y 20,000 microsegundos de retardo.
6. Verifique en R1 y R5 que las rutas del sistema autónomo opuesto existen en su tabla de enrutamiento mediante el comando `show ip route`.

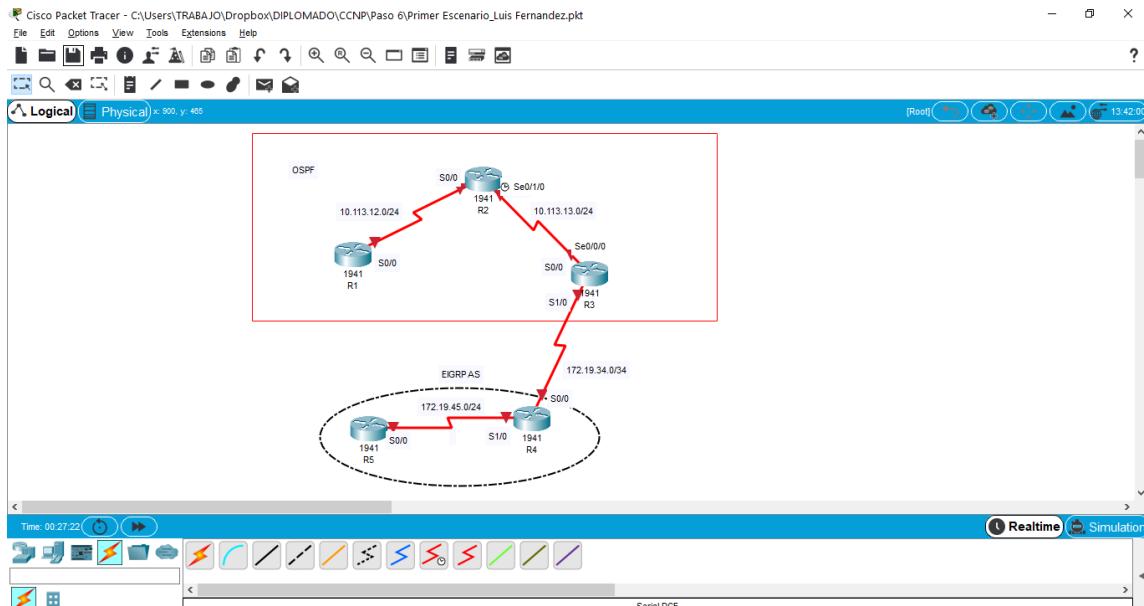

Ilustración 2 Simulación

1. Aplique las configuraciones iniciales y los protocolos de enrutamiento para los routers R1, R2, R3, R4 y R5 según el diagrama. No asigne passwords

en los routers. Configurar las interfaces con las direcciones que se muestran en la topología de red.

Por lo tanto iniciamos la configuración cada uno de los enrutadores. R1, R2, R3, R4, R5 .DE igual manera se lleva a cabo la asignación de nombres y protocolos de comunicación mediante EIGRP asignados.

Adjuntamos código y pantallazos con veracidad del código.

Podemos verificar que las rutas del sistema autónomo opuesto existen en su tabla de enrutamiento en R1 y R5.

## ESCENARIO 2

Una empresa de comunicaciones presenta una estructura Core acorde a la topología de red, en donde el estudiante será el administrador de la red, el cual deberá configurar e interconectar entre sí cada uno de los dispositivos que forman parte del escenario, acorde con los lineamientos establecidos para el direccionamiento IP, etherchannels, VLANs y demás aspectos que forman parte del escenario propuesto.

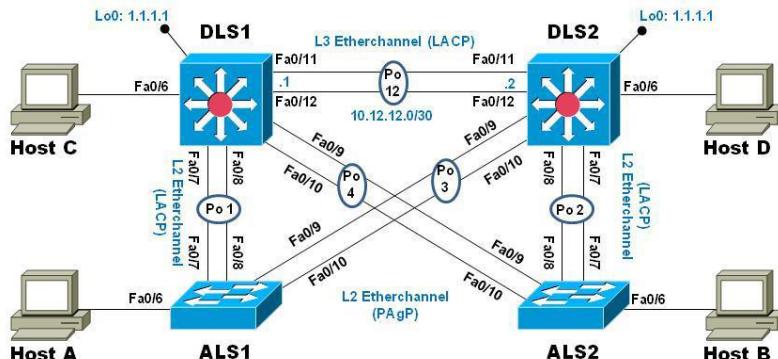

Ilustración 14 Segundo Escenario

## Parte 1: Configurar la red de acuerdo con las especificaciones.

- Apagar todas las interfaces en cada switch.
- Asignar un nombre a cada switch acorde con el escenario establecido.

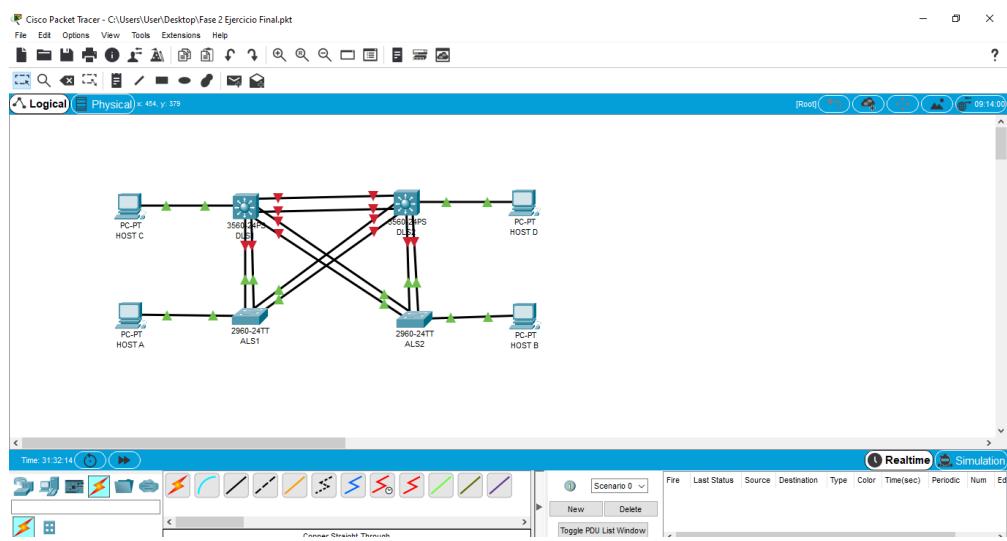

Ilustración 15 Configuración Switches

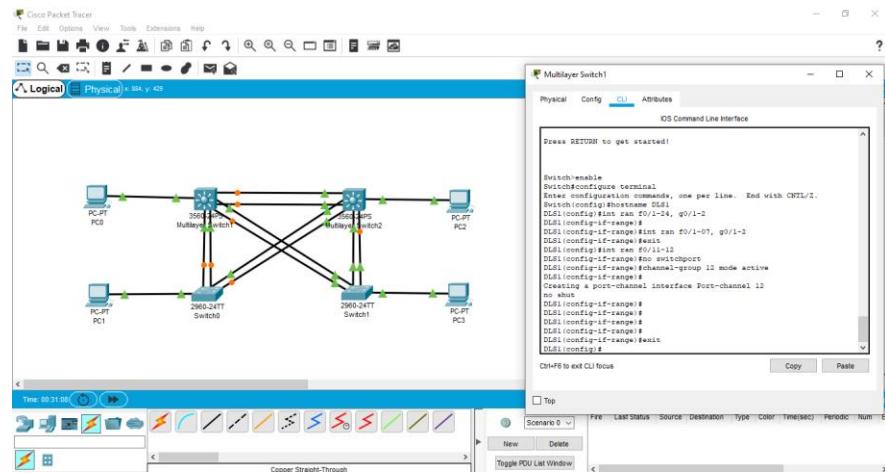

Ilustración 16 Configuracion DLS1

DLS1

```
Switch>en

## ALS1

ALS1>en

ALS1#config t

Enter configuration commands, one per line. End with CNTL/Z.

```

ALS1(config)#interface range f0/9-10
ALS1(config-if-range)#channel-protocol pagp
ALS1(config-if-range)#channel-group 2 mode desirable
ALS1(config-if-range)#no shutdown
ALS1(config-if-range)#
%LINK-5-CHANGED: Interface FastEthernet0/9, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/9, changed state to up
%LINK-5-CHANGED: Interface FastEthernet0/10, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/10, changed state to up
ALS1(config-if-range)#end
ALS1#
%SYS-5-CONFIG_I: Configured from console by console

```

The screenshot shows a terminal window with the following content:

```

ALS1>enable
ALS1#conf t
Enter configuration commands, one per line. End with CNTL/Z.
ALS1(config)#interface range f0/9-10
ALS1(config-if-range)#channel-protocol pagp
ALS1(config-if-range)#channel-group 2 mode desirable
ALS1(config-if-range)#no shutdown
ALS1(config-if-range)#
%LINK-5-CHANGED: Interface FastEthernet0/9, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/9, changed state to up
%LINK-5-CHANGED: Interface FastEthernet0/10, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/10, changed state to up
ALS1(config-if-range)#end
ALS1#
%SYS-5-CONFIG_I: Configured from console by console

```

At the bottom of the window, there are buttons for 'Copy', 'Paste', and 'Paste to CLI'. A small checkbox labeled 'Top' is also visible.

## CONCLUSIONES

Pudimos llevar a cabo en el caso del escenario número dos, la configuración del protocolo PAGP, verificando su funcionamiento en los modos desarable-disarable, auto-disarable, sin embargo dado a que generalmente se aplican en Versión 3 y nuestros switches manejan la versión 2 se genera error al configurar ambos switch en modo auto, en cuanto LACP es funcional activo-activo, activo-pasivo, pero al configurarse ambos switch de forma pasiva se genera igualmente error.

Una de las experiencias más gratificantes de este ejercicio fue la posibilidad de implementar VLANs en un entorno similar a la realidad sabiendo que es un recurso de gran utilidad ya que las VLAN (Red de área local virtual) son redes crea independientes, las cuales no son físicas es decir no requieren un cambio mayor de infraestructura y aumento de costos sino por el contrario ,se efectúan mediante configuración del dispositivo, permitiendo disminuir el tamaño del dominio de difusión y mejorando la administración de la red, al permitir enviar información o actualizaciones a un segmento en particular y siendo escalables al futuro.

En el desarrollo de los dos escenarios los cuales involucran conocimientos sobre protocolos de enrutamiento, manejo de subredes y implementación de medidas de seguridad de redes abarcando al igual otras tantas habilidades recopiladas a través de los cursos de la arquitectura de CISCO se logró una mejor comprensión de estos conocimientos y una mejor apropiación de los mismos.

Como ultima conclusión creo que es necesario que se verifique la aplicación de los escenarios y ejercicios del diplomado, ya que al realizar su implementación en simuladores como GNS3 o CISCO Packet Tracer se generan muchos errores con ciertos comandos o presentan problemas por compatibilidad de los componentes causando demora y algunas veces crash de los sistemas, por lo tanto seria recomendable generar escenarios y ejercicios los cuales sean aplicables a cualquier entorno de desarrollo recordando el carácter virtual de este tipo de educación.
