GLOSARIO

DHCP: es un servidor de Red el cual permite una asignación automática de direcciones IP, gateway predeterminadas, así como otros parámetros de red que necesiten los clientes. El sistema DHCP envía automáticamente todos los parámetros para que los clientes se comuniquen sin problema dentro de la red.

NETWORK: es una red física y lógica que contribuye a lograr estas interconexiones. La misma implica el trabajo conjunto de un número variable de servidores, acumulando con los mismos una capacidad de cómputo significativa.

SLAAC: es un método en el cual un dispositivo puede obtener una dirección IPv6 de unidifusión global sin los servicios de un servidor de DHCPv6. ICMPv6 se encuentra en el centro de SLAAC. ICMPv6 es similar a ICMPv4, pero incluye funcionalidad adicional y es un protocolo mucho más sólido.

SPANNING TREE: es un protocolo de red de capa 2 del modelo OSI. Su función es la de gestionar la presencia de bucles en topologías de red debido a la existencia de enlaces redundantes.

ETHERCHANNEL: es una tecnología de Cisco construida de acuerdo con los estándares 802.3 full-dúplex Fast Ethernet Permite la agrupación lógica de varios enlaces físicos Ethernet, esta agrupación es tratada como un único enlace y permite sumar la velocidad nominal de cada puerto físico Ethernet usado y así obtener un enlace troncal de alta velocidad.

VLAN: es un método para crear redes lógicas independientes dentro de una misma red física. Varias VLAN pueden coexistir en un único commutador físico o en una única red física. Son útiles para reducir el dominio de difusión y ayudan en la administración de la red, separando segmentos lógicos de una red de área local que no deberían intercambiar datos usando la red local.

BGP: es un protocolo mediante el cual se intercambia información de encaminamiento entre sistemas autónomos. Por ejemplo, los proveedores de servicio registrados en Internet suelen componerse de varios sistemas autónomos y para este caso es necesario un protocolo como BGP.

HSRP: es un protocolo propiedad de CISCO que permite el despliegue de enrutadores redundantes tolerantes de fallos en una red. Este protocolo evita la existencia de puntos de fallo únicos (single point of failure) en la red mediante técnicas de redundancia y comprobación del estado de los routers. Evitar puntos únicos de fallo en la red es muy importante para dotar de alta disponibilidad al servicio de red. Es un protocolo muy similar a VRRP, que no es propietario.

RESUMEN

De acuerdo a la topología de red se realiza una serie de configuraciones que van primeramente con la asignación de los parámetros básicos de seguridad y las interfaces de direccionamiento, cada uno de los dispositivos cuenta con una configuración asignada que permite preparar los segmentos de redes de acuerdo a las diferentes capas del modelo OSI; configuración de interfaces troncales que interconectan enlaces de switch, cambios de vlans nativas en los puertos troncales, realización de una configuración apropiada de RSTP puente raíz basada de acuerdo al diagrama de topología, creación de LACP Etherchannel, asignación del protocolo DHCP de acuerdo a la necesidad de red y validación de los direccionamientos obtenidos.

Por otra parte, se tiene que realizar una configuración de protocolos de enrutamiento tanto IPV4 como IPV6, demostrando que la red debería estar completamente convergida, para ello se agregan configuraciones de propagación OSPFv2, configuración áreas únicas en algunos de los dispositivos y configuración de BGP en R2.

PALABRAS CLAVE: CISCO, Comutación, Enrutamiento, Redes, Sistemas.

ABSTRACT

According to the network topology, a series of configurations are made that go first with the assignment of the basic security parameters and the addressing interfaces, each of the devices has an assigned configuration that allows preparing the network segments according to the different layers of the osi model; configuration of trunk interfaces that interconnect switch links, changes native vlans on trunk ports, perform proper root bridge RSTP configuration based on topology diagram, create LACP Etherchannel, assign DHCP protocol as needed network and validation of the addresses obtained.

On the other hand, it is necessary to configure both IPV4 and IPV6 routing protocols, demonstrating that the network should be completely converged, for which OSPFv2 propagation configurations are added, configuration of unique areas in some of the devices and BGP configuration in R2.

KEY WORDS: CISCO, Switching, Routing, Networks, Systems

1. INTRODUCCIÓN

De acuerdo a los desarrollos que deben presentarse al momento de realizar una topología de red, se implementa primeramente la configuración de los dispositivos que conforman esta topología que van desde el cambio en el nombre de host, la desactivación de la búsqueda de dominio, la habilitación del direccionamiento ipv6unicast y la aplicación de mensaje de bienvenida y verificaciones en la línea de consola. Seguido a esto, se realiza la configuración de las interfaces que conforman el direccionamiento, así como la vinculación de interfaces Loopback, aplicación de DHCP y demás configuraciones que dejan lista la topología para realizar las respectivas verificaciones y aseguran la interconexión entre las redes de la compañía.

Luego, se realiza la configuración de la capa 2 de la red y el soporte de Host, habilitando los enlaces trunk 802.1Q entre los switches de capa 3 y el switch de capa2. Enlazando la troncal a la vlan nativa 999, habilitando el protocolo Rapid Spanning-Tree (RSTP), se configuran los puentes raíz RSTP root bridges según la información suministrada del diagrama de topología, complementado por la adición de un respaldo en caso de el puente raíz falle.

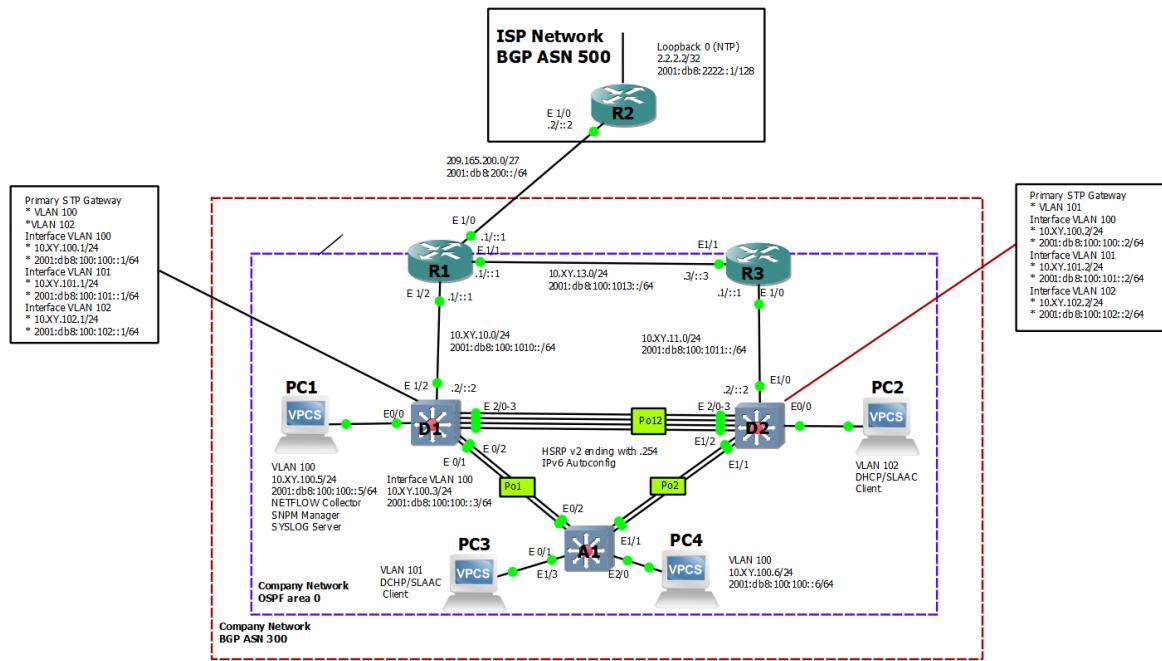

Finalmente se realiza la configuración de los protocolos de enrutamiento en los dispositivos para que la red esté completamente convergente. Para ello se realiza la configuración OSPF tanto para el direccionamiento IPv4 como para el IPv6, se configura MP-BGP en el router R2 y R1.

Objectives

Part 1: Build the Network and Configure Basic Device Settings and Interface Addressing

Part 2: Configure the Layer 2 Network and Host Support

Part 3: Configure Routing Protocols

Part 4: Configure First-Hop Redundancy

Background / Scenario

In this skills assessment, you are responsible for completing the configuration of the network so there is full end-to-end reachability, so the hosts have reliable default gateway support, and so that management protocols are operational within the “Company Network” part of the topology. Be careful to verify that your configurations meet the provided specifications and that the devices perform as required.

Note: The routers used with CCNP hands-on labs are Cisco 7200 routers. The switches used in the labs are Cisco Catalyst L2 switches. Other routers, switches, and Cisco IOS versions can be used. Depending on the model and Cisco IOS version, the commands available and the output produced might vary from what is shown in the labs.

Note: Make sure that the switches have been erased and have no startup configurations. If you are unsure, contact your instructor.

Note: The letters "X, Y" represent the last two digits of your ID number (cédula).

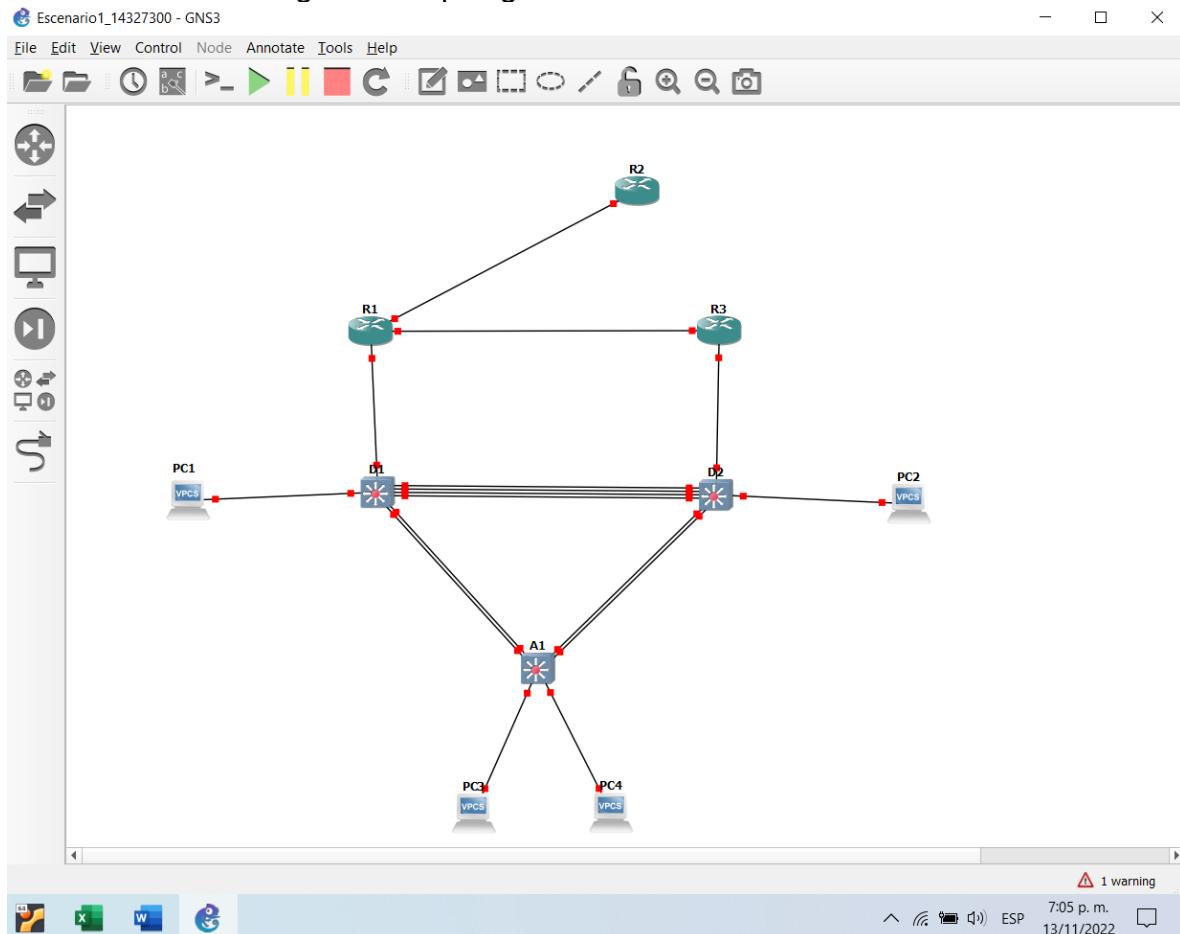

2.1.1. Part 1: Build the Network and Configure Basic Device Settings and Interface Addressing

In Part 1, you will set up the network topology and configure basic settings and interface addressing.

Step 1. Cable the network as shown in the topology.

Attach the devices as shown in the topology diagram, and cable as necessary.

Figura 2. Topología del escenario 1 en GNS3.

Fuente: Autor del documento.

Step 2. Configure basic settings for each device.

- Console into each device, enter global configuration mode, and apply the basic settings. The startup configurations for each device are provided below.

Router R1

```
R1#configure terminal  
R1(config)#hostname R1  
dispositivo  
R1(config)#ipv6 unicast-routing

b. Save the running configuration to startup-config on all devices.

R1#copy running-config startup-config del dispositivo	//Se guarda la configuracion
R2#copy running-config startup-config del dispositivo	//Se guarda la configuracion
R3#copy running-config startup-config del dispositivo	//Se guarda la configuracion
D1#copy running-config startup-config del dispositivo	//Se guarda la configuracion
D2#copy running-config startup-config del dispositivo	//Se guarda la configuracion
A1#copy running-config startup-config del dispositivo	//Se guarda la configuracion

- c. Configure PC 1 and PC 4 host addressing as shown in the addressing table.
 Assign a default gateway address of 10.0.100.254 which will be the HSRP virtual IP address used in Part 4.

PC1> ip 10.0.100.5 255.255.255.0 10.0.100.254 direccionamiento IPv4 del equipo	//Se configura el
PC1> ip 2001:db8:100:100::5/64 eui-64 direccionamiento IPv6 del equipo	//Se configura el
PC4> ip 10.0.100.6 255.255.255.0 10.0.100.254 direccionamiento IPv4 del equipo	//Se configura el
PC4> ip 2001:db8:100:100::6/64 eui-64 direccionamiento IPv6 del equipo	//Se configura el

2.1.2. Part 2. Configure the Layer 2 Network and Host Support

In this part of the Skills Assessment, you will complete the Layer 2 network configuration and set up basic host support. At the end of this part, all the switches should be able to communicate. PC2 and PC3 should receive addressing from DHCP and SLAAC.

Your configuration tasks are as follows:

Tabla 2. Tabla de tareas a realizar en la parte 2.

Task#	Task	Specification
2.1	On all switches, configure IEEE 802.1Q trunk interfaces on interconnecting switch links	Enable 802.1Q trunk links between: <ul style="list-style-type: none">• D1 and D2• D1 and A1• D2 and A1
2.2	On all switches, change the native VLAN on trunk links.	Use VLAN 999 as the native VLAN.
2.3	On all switches, enable the Rapid Spanning-Tree Protocol.	Use Rapid Spanning Tree.
2.4	On D1 and D2, configure the appropriate RSTP root bridges based on the information in the topology diagram. D1 and D2 must provide backup in case of root bridge failure.	Configure D1 and D2 as root for the appropriate VLANs with mutually supporting priorities in case of switch failure.
2.5	On all switches, create LACP EtherChannels as shown in the topology diagram.	Use the following channel numbers: <ul style="list-style-type: none">• D1 to D2 – Port channel 12• D1 to A1 – Port channel 1• D2 to A1 – Port channel 2
2.6	On all switches, configure host access ports connecting to PC1, PC2, PC3, and PC4.	Configure access ports with appropriate VLAN settings as shown in the topology diagram. Host ports should transition immediately to forwarding state.
2.7	Verify IPv4 DHCP services.	PC2 and PC3 are DHCP clients and should be receiving valid IPv4 addresses.
2.8	Verify local LAN connectivity.	PC1 should successfully ping: <ul style="list-style-type: none">• D1: 10.0.100.1• D2: 10.0.100.2

Task#	Task	Specification
		<ul style="list-style-type: none"> • PC4: 10.0.100.6 <p>PC2 should successfully ping:</p> <ul style="list-style-type: none"> • D1: 10.0.102.1 • D2: 10.0.102.2 <p>PC3 should successfully ping:</p> <ul style="list-style-type: none"> • D1: 10.0.101.1 • D2: 10.0.101.2 <p>PC4 should successfully ping:</p> <ul style="list-style-type: none"> • D1: 10.0.100.1 • D2: 10.0.100.2 • PC1: 10.0.100.5

2.1.3. Part 3: Configure Routing Protocols

In this part, you will configure IPv4 and IPv6 routing protocols. At the end of this part, the network should be fully converged. IPv4 and IPv6 pings to the Loopback 0 interface from D1 and D2 should be successful.

Note: Pings from the hosts will not be successful because their default gateways are pointing to the HSRP address which will be enabled in Part 4.

Your configuration tasks are as follows:

Tabla 3. Tabla de tareas a realizar en la parte 3.

Task#	Task	Specification
3.1	On the “Company Network” (i.e., R1, R3, D1, and D2), configure	<p>Use OSPF Process ID 4 and assign the following router-IDs:</p> <ul style="list-style-type: none"> • R1: 0.0.4.1 • R3: 0.0.4.3 • D1: 0.0.4.131 • D2: 0.0.4.132

Task#	Task	Specification
	single-area OSPFv2 in area 0.	<p>On R1, R3, D1, and D2, advertise all directly connected networks / VLANs in Area 0.</p> <ul style="list-style-type: none"> • On R1, do not advertise the R1 – R2 network. • On R1, propagate a default route. Note that the default route will be provided by BGP. <p>Disable OSPFv2 advertisements on:</p> <ul style="list-style-type: none"> • D1: All interfaces except E1/2 • D2: All interfaces except E1/0
3.2	On the “Company Network” (i.e., R1, R3, D1, and D2), configure classic single-area OSPFv3 in area 0.	<p>Use OSPF Process ID 6 and assign the following router-IDs:</p> <ul style="list-style-type: none"> • R1: 0.0.6.1 • R3: 0.0.6.3 • D1: 0.0.6.131 • D2: 0.0.6.132 <p>On R1, R3, D1, and D2, advertise all directly connected networks / VLANs in Area 0.</p> <ul style="list-style-type: none"> • On R1, do not advertise the R1 – R2 network. • On R1, propagate a default route. Note that the default route will be provided by BGP. <p>Disable OSPFv3 advertisements on:</p> <ul style="list-style-type: none"> • D1: All interfaces except E1/2 • D2: All interfaces except E1/0
3.3	On R2 in the “ISP Network”, configure MP-BGP.	<p>Configure two default static routes via interface Loopback 0:</p> <ul style="list-style-type: none"> • An IPv4 default static route. • An IPv6 default static route. <p>Configure R2 in BGP ASN 500 and use the router-id 2.2.2.2.</p> <p>Configure and enable an IPv4 and IPv6 neighbor relationship with R1 in ASN 300.</p> <p>In IPv4 address family, advertise:</p> <ul style="list-style-type: none"> • The Loopback 0 IPv4 network (/32). • The default route (0.0.0.0/0). <p>In IPv6 address family, advertise:</p>

Task#	Task	Specification
		<ul style="list-style-type: none"> The Loopback 0 IPv4 network (/128). The default route (::/0).
3.4	On R1 in the “ISP Network”, configure MP-BGP.	<p>Configure two static summary routes to interface Null 0:</p> <ul style="list-style-type: none"> A summary IPv4 route for 10.XY.0.0/8. A summary IPv6 route for 2001:db8:100::/48. <p>Configure R1 in BGP ASN 300 and use the router-id 1.1.1.1.</p> <p>Configure an IPv4 and IPv6 neighbor relationship with R2 in ASN 500.</p> <p>In IPv4 address family:</p> <ul style="list-style-type: none"> Disable the IPv6 neighbor relationship. Enable the IPv4 neighbor relationship. Advertise the 10.XY.0.0/8 network. <p>In IPv6 address family:</p> <ul style="list-style-type: none"> Disable the IPv4 neighbor relationship. Enable the IPv6 neighbor relationship. Advertise the 2001:db8:100::/48 network.

2.1.4. Part 4: Configure First Hop Redundancy

In this part, you will configure HSRP version 2 to provide first-hop redundancy for hosts in the “Company Network”.

Your configuration tasks are as follows:

Tabla 4. Tabla de tareas a realizar en la parte 4.

Task#	Task	Specification
4.1	On D1, create IP SLAs that test the reachability of R1 interface E1/2.	<p>Create two IP SLAs.</p> <ul style="list-style-type: none"> • Use SLA number 4 for IPv4. • Use SLA number 6 for IPv6. <p>The IP SLAs will test availability of R1 E1/2 interface every 5 seconds.</p> <p>Schedule the SLA for immediate implementation with no end time.</p> <p>Create an IP SLA object for IP SLA 4 and one for IP SLA 6.</p> <ul style="list-style-type: none"> • Use track number 4 for IP SLA 4. • Use track number 6 for IP SLA 6. <p>The tracked objects should notify D1 if the IP SLA state changes from down to up after 10 seconds, or from up to down after 15 seconds.</p>
4.2	On D2, create IP SLAs that test the reachability of R3 interface E1/0.	<p>Create two IP SLAs.</p> <ul style="list-style-type: none"> • Use SLA number 4 for IPv4. • Use SLA number 6 for IPv6. <p>The IP SLAs will test availability of R3 E1/0 interface every 5 seconds.</p> <p>Schedule the SLA for immediate implementation with no end time.</p> <p>Create an IP SLA object for IP SLA 4 and one for IP SLA 6.</p> <ul style="list-style-type: none"> • Use track number 4 for IP SLA 4. • Use track number 6 for IP SLA 6.

Task#	Task	Specification
		The tracked objects should notify D1 if the IP SLA state changes from down to up after 10 seconds, or from up to down after 15 seconds.
4.3	On D1, configure HSRPv2.	<p>D1 is the primary router for VLANs 100 and 102; therefore, their priority will also be changed to 150.</p> <p>Configure HSRP version 2.</p> <p>Configure IPv4 HSRP group 104 for VLAN 100:</p> <ul style="list-style-type: none"> • Assign the virtual IP address 10.XY.100.254. • Set the group priority to 150. • Enable preemption. • Track object 4 and decrement by 60. <p>Configure IPv4 HSRP group 114 for VLAN 101:</p> <ul style="list-style-type: none"> • Assign the virtual IP address 10.XY.101.254. • Enable preemption. • Track object 4 to decrement by 60. <p>Configure IPv4 HSRP group 124 for VLAN 102:</p> <ul style="list-style-type: none"> • Assign the virtual IP address 10.XY.102.254. • Set the group priority to 150. • Enable preemption. • Track object 4 to decrement by 60. <p>Configure IPv6 HSRP group 106 for VLAN 100:</p> <ul style="list-style-type: none"> • Assign the virtual IP address using ipv6 autoconfig. • Set the group priority to 150. • Enable preemption. • Track object 6 and decrement by 60. <p>Configure IPv6 HSRP group 116 for VLAN 101:</p> <ul style="list-style-type: none"> • Assign the virtual IP address using ipv6 autoconfig. • Enable preemption. • Track object 6 and decrement by 60. <p>Configure IPv6 HSRP group 126 for VLAN 102:</p> <ul style="list-style-type: none"> • Assign the virtual IP address using ipv6 autoconfig. • Set the group priority to 150. • Enable preemption. • Track object 6 and decrement by 60.
	On D2, configure HSRPv2.	<p>D2 is the primary router for VLAN 101; therefore, the priority will also be changed to 150.</p> <p>Configure HSRP version 2.</p> <p>Configure IPv4 HSRP group 104 for VLAN 100:</p>

Task#	Task	Specification
		<ul style="list-style-type: none"> • Assign the virtual IP address 10.XY.100.254. • Enable preemption. • Track object 4 and decrement by 60. <p>Configure IPv4 HSRP group 114 for VLAN 101:</p> <ul style="list-style-type: none"> • Assign the virtual IP address 10.XY.101.254. • Set the group priority to 150. • Enable preemption. • Track object 4 to decrement by 60. <p>Configure IPv4 HSRP group 124 for VLAN 102:</p> <ul style="list-style-type: none"> • Assign the virtual IP address 10.XY.102.254. • Enable preemption. • Track object 4 to decrement by 60. <p>Configure IPv6 HSRP group 106 for VLAN 100:</p> <ul style="list-style-type: none"> • Assign the virtual IP address using ipv6 autoconfig. • Enable preemption. • Track object 6 and decrement by 60. <p>Configure IPv6 HSRP group 116 for VLAN 101:</p> <ul style="list-style-type: none"> • Assign the virtual IP address using ipv6 autoconfig. • Set the group priority to 150. • Enable preemption. • Track object 6 and decrement by 60. <p>Configure IPv6 HSRP group 126 for VLAN 102:</p> <ul style="list-style-type: none"> • Assign the virtual IP address using ipv6 autoconfig. • Enable preemption. • Track object 6 and decrement by 60.

CONCLUSIONES

CCNP proporciona a los estudiantes los conocimientos y habilidades necesarios para planificar, implementar, proteger y mantener soluciones a fallas de red en un negocio convergente. CCNP tiene como objetivo reflejar habilidades y responsabilidades laborales relacionadas con los roles profesionales de ingeniería Ingeniero de redes, ingeniero de sistemas, ingeniero de soporte de redes, administrador de redes Ingeniero de telecomunicaciones de red, consultor de redes e integrador de sistemas y otras carreras relacionadas.

Esta prueba permite comprender como sería la aplicación de varios conceptos de redes, la implementación de técnicas y la verificación de aplicaciones realizadas a los dispositivos, que van desde la implementación de vlans en dispositivos switch capa 3, la habilitación del enrutamiento ipv6 y la ejecución de BGP con un ASN designado.
